### 1. EXECUTIVE SUMMARY

### 1.1. Summary of Work

This report provides an overview of an asbestos and lead paint inspection of Bridge Structure ID J-14-C, located on State Highway 9 at Mile Post 20.111. Walsh Environmental Scientists and Engineers, LLC (Walsh) was contracted by the Colorado Department of Transportation (CDOT) to perform a pre-demolition/renovation inspection to locate asbestos-containing building materials (ACBM) and to conduct a limited screening for Lead-Based Paint (LBP) due to planned demolition/renovation activities. The inspection was conducted in accordance with CDOT Contract No. 201000559 including Exhibit A (statement of work) and in accordance with applicable EPA, OSHA and CDPHE regulations. The inspection was performed on February 2, 2012.

The following were specific structures at the site <u>included</u> in the demolition/renovation specific inspection:

• State Highway 9 Bridge ID: J-14-C at Mile Post 20.111.

The following were specific structures <u>excluded</u> in the demolition/renovation specific inspection:

None

### 1.2. Asbestos-Containing Material

The sampling and inspection process was conducted in accordance with standards of the Environmental Protection Agency (EPA) Asbestos Emergency Hazard Response Act (AHERA) and National Emission Standards for Hazardous Air Pollutants (NESHAPs), Occupational Safety and Health Administration (OSHA) Construction and General Industry Standards for asbestos, Colorado Department of Public Health and Environment (CDPHE) Regulation 8 (Reg. 8), and other applicable industry standards. Asbestos inspection activities were conducted by AHERA and State of Colorado accredited personnel.

The inspection identified six (6) suspected asbestos-containing homogeneous areas. One (1) functional space was identified and inspected. Six (6) bulk samples were collected during the inspection. A material is considered to be asbestos containing building material (ACBM) if the asbestos content is greater than 1% asbestos. Asbestos was not reported in the samples collected during this inspection.

### **Special Conditions / Observations**

In addition to general limitations described in Section 8, the following materials have the potential to be asbestos containing but cannot be accessed or inspected due to access limitations, operational considerations, or safety issues (e.g. electrical hazards):

Packing and gasket material associated with expansion joints within the bridge structure.
 These materials were not observed during the inspection, but may be present in spaces that were concealed with concrete and/or asphalt within the structure.

See Section 7 (Recommendations) for requirements prior to demolition activities that may impact ACBM

### 1.3. Lead-Based Paint

EPA, HUD and CDPHE define lead-based paint as paint having a lead content of greater than or equal to 1.0 mg/cm2 using XRF analysis, or 0.5 weight percent using flame atomic absorption analysis.

Walsh conducted a limited LBP survey at the site by collecting a limited number of representative paint bulk samples that were analyzed by analysis by atomic absorption spectrometry (AAS) for lead content. The limited LBP survey was conducted due to planned renovation or demolition of a structure and is solely for general disclosure purposes to provide contractors with information regarding those materials containing the highest levels of lead, to supplement presumption that all painted surfaces contain some level of lead. This disclosure is provided to those employers that may impact painted materials about general conditions that may be encountered for a particular building. The screening is also conducted to provide general information regarding demolition/renovation waste characterization/disposition (proper disposal).

Lead-Based Paint (>0.5% by weight) was identified during the inspection. The following component was confirmed to be LBP:

### **Lead-Based Paint (LBP)**

■ Wood – White – Located on Wooden Railing on sides of bridge.

The following component types was confirmed to be lead-containing (<0.5% by weight) and should be disclosed to the demolition contractor, and are subject to waste determination procedures.

### Lead-Containing Paint (LCP).

- Steel Silver Located on Guardrails
- Steel Silver Located on Support Understructure of Bridge.
- Asphalt White Located on Road Surface.

Demolition activities involving lead-based paint are covered under the OSHA Construction Industry Standard for Lead (Title 29 of the Federal Code of Regulations, Part 1926.62). This standard addresses such issues as worker training, medical evaluations, personnel protective equipment, exposure assessment, air monitoring, hygiene facilities and practices, and health and safety plans. OSHA regulations do not define a minimum concentration of lead as a threshold for action. Thus, even concentrations below EPA/HUD/CDPHE levels are covered under OSHA regulations.

Additionally, lead-containing materials require a hazardous waste determination pursuant to 40 CFR 262.11, and 40 CFR 261.24. It is a standard industry approach that demolition waste characterization should be performed on structures containing lead-based paint. This procedure is the Toxicity Characteristic Leaching Process (TCLP), where a composite sample representative of all building components to be demolished (i.e. all lead-based paint coated and non-lead-based paint coated materials from the structure) is submitted to the laboratory for analysis. The Toxicity Characteristic (TC) limit for lead is 5ppm in the leachate. Materials that exceed this limit must be disposed of as hazardous waste. Materials that do not exceed this limit may be disposed of as solid waste. Since LCP was identified, TCLP waste characterization would be a standard industry approach.

The types and locations of lead-containing paint (LCP), and regulatory requirements should be disclosed to the demolition contractor and/or salvage contractor to avoid accidental disturbance, and for contractor compliance with applicable regulations (to ensure proper worker protection).

See Section 7 (Recommendations) for requirements prior to demolition activities that may impact LBP.

### 2. STRUCTURE INFORMATION

The following summary provides specific structure, scope of inspection, areas inspected and functional space information relevant to the inspection.

Bridge Structure ID: J-14-C consists as a Thirty-one Mile Creek overpass on SH 9 at Mile Post 20.111 in Park County, Colorado. The Treated Timber Stringer Bridge was constructed in 1934 with wooden post guardrails on either side. The bridge is 48-feet long and 25-feet wide. The entire bridge is considered one functional space for inspection purposes.

View of Bridge Structure ID: J-14-C on State Highway 9.

### 3. FUNCTIONAL SPACE INFORMATION

The following summary provides basic information for specific materials inspected, including location, description, dimensions, and other observations. This summary also identifies those areas that were inaccessible and could not be inspected, which will require inspection prior to renovation activities.

One functional space (bridge) was identified. Six materials were identified as suspect asbestos-containing and sampled during the inspection and are listed below:

- Asphalt with Black Tar.
- Silver Paint on guardrails.
- Silver Paint on understructure of bridge.
- White Paint on wooden railing on sides of bridge.
- White Lane Paint on surface of road
- Yellow Lane Paint on surface of road.

No other suspect asbestos-containing materials were identified during the inspection.

### 4. INSPECTION METHODOLOGY

### 4.1. Asbestos-Containing Material

The sampling and destructive investigation process was conducted in accordance with AHERA under Title 40 of the Federal Register, CDPHE Regulation 8, and other applicable industry standards (including EPA, NESHAP, OSHA asbestos regulations, and asbestos regulations.) Asbestos inspection activities were conducted by AHERA and State of Colorado accredited personnel.

The scope of the asbestos inspection was to identify ACBM and included the following steps:

- Visual inspection of all accessible areas of the structure to identify suspect materials.
- Visual inspection of all areas of suspect ACBM.
- Determination of friability by touching all suspect ACBM.
- Development of a sampling plan for each material based on the homogeneous type, friability, accessibility and material locations. Samples were submitted for laboratory analysis by Polarized Light Microscopy (PLM).
- Inspection in two phases: comprehensive non-destructive inspection for accessible areas, followed by destructive investigation (creating large openings in walls, ceilings, chases, etc) to identify ACBM in previously inaccessible areas.

A homogeneous area (material) is defined as an area containing a material that appears similar throughout with regard to color, texture, and date of application. Individual systems that were inspected, but not suspected to contain asbestos, are not included in this report. Such systems include concrete, carpet, fiberglass, plastic, and wood products.

Each type of suspect building material (homogeneous area) was assigned an alpha material code, followed by a number to identify the different varieties of that building material. For example, ceiling tiles are designated by the material code of CT. Each type of ceiling tile was denoted by subsequent "type" number (CT-01, CT-02, etc). Material size, thickness, substrate, material friability, location, and quantity were recorded. Material information was recorded on a room-by-room (functional space) inventory form (and/or Walsh Asbestos Inspection Form).

The homogeneous area was classified into one of three available types of homogeneous material descriptions.

- Surfacing Material refers to a wide range of trowel or spray-applied materials typically used for acoustical or fireproofing purposes. Examples include spray-applied fireproofing and acoustical texture ceilings.
- **Thermal System Insulation (TSI)** refers to insulation that is applied to heating or mechanical system components. Examples include pipe, tank and boiler insulation.
- **Miscellaneous Materials** refers to all other materials that do not fall into one of the above categories. Examples include floor tile, adhesives, and ceiling tiles.

Once the homogeneous area was determined it was then classified as friable or non-friable. The EPA distinguishes between friable and nonfriable forms of ACBM. Friable materials can be crumbled or reduced to powder by hand pressure, whereas nonfriable materials cannot. Friable materials are more likely to be released into the air, especially during renovation and demolition of the building. Therefore, the distinction between friable and nonfriable homogeneous material is important.

The following Bulk Sampling protocol for friable and Category I and II nonfriable materials was used to determine the number of samples to be collected for friable materials and non-friable materials deemed potential Regulated Asbestos-Containing Material (RACM, non-friable materials with potential to be rendered friable during normal demolition).

**Bulk Sampling Strategy** 

	211118 21111108		
Material	Homogeneous	Units	Minimum
	Area		Number of
			Samples
Friable Surfacing	Less than 1000	SF	3
-	1000 to 5000		5
	More than 5000		7
Nonfriable Surfacing		SF	3
Friable and NonFriable Thermal System Insulation		LF / SF / EA	3*
Friable and NonFriable Miscellaneous Materials		LF / SF / EA	3*

<sup>\*</sup> One sample was collected for limited quantity replacement or patch (salient) materials.

### 4.2. Lead-Based Paint

Walsh conducted a limited LBP survey at the site by collecting a limited number of representative paint chip samples that were analyzed by atomic absorption spectrometry (AAS) for lead content. The limited LBP survey was conducted due to planned renovation or demolition of a structure and is solely for general disclosure purposes to provide contractors with information regarding those materials containing the highest levels of lead, to supplement presumption that all painted surfaces contain some level of lead. This disclosure is provided to those employers that may impact painted materials during renovation or demolition activities and The screening is also conducted to provide general information regarding demolition/renovation waste characterization/disposition (proper disposal).

The lead inspection used methods adapted from the Housing and Urban Development (HUD) Guidelines for the Evaluation and Control of Lead-Based paint in Housing, June, 1995.

### 5. BULK SAMPLING AND LABORATORY ANALYSIS

### 5.1. Asbestos-Containing Material

As part of the inspection, bulk samples of suspect materials were collected by accredited asbestos inspectors in a random and representative manner as determined by each inspector. Samples were collected by taking a core sample that included all layers within the suspect material. Samples from soft friable materials were obtained by removing a small portion using wetting techniques. All samples were placed in sealed, labeled containers, and the sample descriptions and locations were recorded. Digital photographs were also taken to provide a visual reference for each material. At the time of collection, samples were labeled with an appropriate and unique number. This number (along with other information such as sample location, color, texture, and condition) was recorded on the inspection form.

The inspector delivered the samples along with a completed chain-of-custody (COC) document to the laboratory. The laboratory then arranged the samples in numerical order. If a discrepancy between the samples exists, this is noted and initialed on the COC. The laboratory signed a copy of the COC to acknowledge receipt. The inspector retained the signed copy for evidentiary purposes. Further, the laboratory assigned a laboratory number to each sample received. The laboratory labeled both the analytical report and the sample container with this laboratory number for cross-reference purposes.

The bulk samples were submitted for progressive analysis (positive stop) to Reservoirs Environmental Services Inc., a National Volunteer Laboratory Accreditation Program (NVLAP) accredited laboratory. Under progressive analysis, once a positive result is obtained within a sample set, all subsequent samples within that set are not analyzed (as a cost savings measure).

Analysis of the bulk samples was performed using PLM using procedures developed by McCrone Research Institute, and in compliance with the guidelines established by the Environmental Protection Agency (EPA-600/B-93/116, Dec. 1982) to determine asbestos type and content. The PLM samples are reported as percent asbestos by Calibrated Visual Area Estimation. Percent asbestos for separate layers and total for the sample are delineated in the laboratory report. Unused portions of samples are archived for six months unless the client requests special handling.

As of November 20, 1990, the EPA NESHAP requires that samples with less than 10 percent asbestos be analyzed by the point-count procedure, or must be assumed positive for asbestos. CDPHE regulations require that samples containing 1 percent or less asbestos be analyzed under the point-counting method (to avoid false negatives, or inaccurately classifying asbestos-containing material as non-asbestos-containing material). The analytical and laboratory reports are located in Appendix D of this report.

The following summary provides specific information for suspect homogeneous materials identified, bulk sampling, and analytical results.

TABLE 1 - SUMMARY OF ASBESTOS ANALYSIS

HOMOGENEOUS AREA	MATERIAL DESCRIPTION	ASBESTOS CONTENT	LOCATION	QUANTITY
J-14-C-AP01	Black Asphalt with Black Tar	ND	Two Layers on bridge roadway	~1,200 SF
J-14-C-PA01	Silver Paint	ND	Steel Guardrails	~1,950 SF
J-14-C-PA02	Silver Paint	ND	Metal Understructure Support of Bridge	~100 SF
J-14-C-PA03	White Paint	ND	Wooden Railings on Sides of Bridge	~650 SF
J-14-C-PA04	White Road Paint	ND	White Road Lane Paint	~96 LF
J-14-C-PA05	Yellow Road Paint	ND	Yellow Road Lane Paint	~20 LF

### 5.2. Lead-Based Paint

Paint (chip) samples were collected by physically removing a small portion (approximately 2 inches square) using a cutting or coring tool. Each sample was placed into a sealed and labeled container, and sample locations and descriptions were recorded.

The inspector delivered the samples along with a completed chain-of-custody (COC) document to the laboratory. The laboratory then arranged the samples in numerical order. If a discrepancy between the samples exists, this is noted and initialed on the COC. The laboratory signed a copy of the COC to acknowledge receipt. The inspector retained the signed copy for evidentiary purposes. Further, the laboratory assigned a laboratory number to each sample received. The laboratory labeled both the analytical report and the sample container with this laboratory number for cross-reference purposes.

The chip samples were submitted to Reservoirs Environmental Services Inc. for analysis by Atomic Absorption Analysis (AAS).

The following summary provides the results of lead analysis by AAS

Sample ID	Location	Substrate	Color	Condition	Result % by weight
LBP01	Steel Guardrails	Metal	Silver	Good	0.040%
LBP02	Metal Understructure Support of Bridge	Metal	Silver	Significantly Damaged	0.084%
LBP03	Wooden Railings on Sides of Bridge	Wood	White	Damaged	4.518%
LBP04	White Road Lane Paint	Asphalt	White	Significantly Damaged	0.010%
LBP05	Yellow Road Lane Paint	Asphalt	Yellow	Significantly Damaged	BRL

BRL = Below Reporting Limit

### Representative Photos are below:

The analytical and laboratory reports are located in Appendix D of this report.

### 6. FINDINGS

### 6.1. Asbestos-Containing Material

EPA, OSHA and CDPHE define asbestos-containing material (ACM) as any material containing greater than 1% asbestos. EPA and CDPHE define asbestos-containing building material (ACBM) as any building material containing greater than 1% asbestos. The following summary provides listings of ACBM:

Asbestos-containing materials were not identified as part of this inspection.

### 6.2. Lead-Based Paint

Lead-Based Paint (>0.5% by weight) was identified during the inspection. The following component was confirmed to be LBP:

### **Lead-Based Paint (LBP)**

■ Wood – White – Located on Wooden Railing, Sides of Bridge.

The following **component types** were confirmed to be lead-containing (<0.5% by weight) and should be disclosed to the demolition contractor, and are subject to waste determination procedures.

### Lead-Containing Paint (LCP)

- Steel Silver Located on Guardrails
- Metal Silver Located on Understructure Support of Bridge.
- Asphalt White Located on road surface.

### 7. RECOMMENDATIONS

### 7.1. Asbestos-Containing Material

All regulated asbestos-containing materials (RACMs) are required by regulation to be properly removed and disposed of prior to renovation or demolition activities. The proper removal and handling of these materials is typically addressed through the preparation of a written "abatement scope of work/specification" document (bid package).

Under normal demolition activities, nonfriable Category I non-RACMs (nonfriable materials such as floor tile, roofing, and gasket material) and similar nonfriable Category II non-RACMs are allowed to remain, and can be disposed of as normal demolition debris, provided these materials remain nonfriable during demolition activities. Some landfills allow the material to be disposed with construction debris; however, the waste hauler and landfill must be notified that they are receiving a Category 1 non-friable asbestos material. If the material is removed as an asbestos removal project it should be disposed of as non-friable asbestos waste.

Materials containing 1% or less asbestos (as verified by point count) are not subject to EPA and CDPHE requirements, and therefore may remain during building demolition. Non-RACMs and materials containing 1% or less asbestos may be subject to OSHA regulations if air concentrations are at or above the personal exposure limit (PEL) of 0.1f/cc or the excursion limit of 1.0 f/cc.

Asbestos-containing materials or trace-1% asbestos materials were not identified during the inspection; therefore, materials are not subject to the above-referenced provisions.

### 7.2. Lead-Based Paint and Lead-Containing Paint

Renovation and demolition activities involving lead-based paint are the OSHA Construction Industry Standard for Lead (Title 29 of the Federal Code of Regulations, Part 1926.62). This standard addresses such issues as worker training, medical evaluations, personnel protective equipment, exposure assessment, biological monitoring, air monitoring, hygiene facilities and practices, and health and safety plans. OSHA regulations do not define a minimum concentration of lead as a threshold for action. Thus, even concentrations below EPA/HUD/CDPHE levels are regulated by OSHA.

Additionally, lead containing materials require a hazardous waste determination pursuant to 40 CFR 262.11, and 40 CFR 261.24. It is a standard industry approach that demolition waste characterization should be performed on structures containing lead-based paint. This procedure is the Toxicity Characteristic Leaching Process (TCLP), where a composite sample representative of all building components to be demolished (i.e. all lead-based paint coated and non-lead-based paint coated materials from the structure) is submitted to the laboratory for analysis. The Toxicity Characteristic (TC) limit for lead is 5ppm in the leachate. Materials that exceed this limit must be disposed of as hazardous waste. Materials that do not exceed this limit may be disposed of as solid waste. Since LCP was identified, TCLP waste characterization would be a standard industry approach.

The types and locations of lead-containing paint (LCP), and regulatory requirements should be disclosed to the demolition contractor and/or salvage contractor to avoid accidental disturbance, and for contractor compliance with applicable regulations (to ensure proper worker protection).

### 8. LIMITATIONS

No survey can completely eliminate the uncertainty regarding the presence of asbestos-containing materials, lead-based paint and other hazardous material. The level of diligence and investigative procedures utilized are intended to reduce, but not eliminate potential uncertainty regarding the presence of these materials. The procedures used for this survey attempted to establish a balance between the competing goals of inspection cost, time and aesthetic damage. The determinations of this report should not be construed as a guarantee that all such materials present in the subject property have been identified in the report.

The inspection was performed in a manner consistent with the level of care and expertise exercised by members of the asbestos inspection and assessment profession. Those entities and persons involved with the inspection and generation of this report do not imply or guarantee that all potential asbestos-containing materials on or in the building has been identified or sampled. Historically, asbestos has been added as a component to over 3,000 materials and products produced in the United States. The inspection was intended to identify those accessible materials that were reasonably suspect and that were most likely to contain asbestos in quantities subject to regulation, based on existing industry and regulatory standards.

Destructive investigation activities were conducted to identify materials in previously inaccessible areas (behind walls, above ceilings, etc), using limited demolition methods. These activities created small openings for investigation, but are limited in that full observation is not possible due to the presence of walls, flooring, ceilings, etc. Informational (hazard communication) training for demolition supervisory staff and workers, and additional inspection by an accredited asbestos inspector during demolition may assist in identifying any other hidden or concealed materials that may exist in the building.

Drawings and diagrams contained in this report are for informational purposes only, and proportion and scales are approximate.

# LABORATORY REPORTS AND CHAIN OF CUSTODY FORMS

February 17, 2012

Laboratory Code: RES Subcontract Number: NA

Laboratory Report: RES 229473-1
Project # / P.O. # WA-000944-0160-10
Project Description: CDOT Region 1 HY 9

Aaron Ardourel Walsh Environmental - (Colo. Springs) 130 E. Kiowa Suite 202 Colorado Springs CO 80903

Dear Customer,

Reservoirs Environmental, Inc. is an analytical laboratory accredited for the analysis of Industrial Hygiene and Environmental matrices by the National Voluntary Laboratory Accreditation Program (NVLAP), Lab Code 101896-0 for Transmission Electron Microscopy (TEM) and Polarized Light Microscopy (PLM) analysis and the American Industrial Hygiene Association (AIHA), Lab ID 101533 - Accreditation Certificate #480 for Phase Contrast Microscopy (PCM) analysis. This laboratory is currently proficient in both Proficiency Testing and PAT programs respectively.

Reservoirs Environmental, Inc. has analyzed the following samples for asbestos content as per your request. The analysis has been completed in general accordance with the appropriate methodology as stated in the attached analysis table. The results have been submitted to your office.

**RES 229473-1** is the job number assigned to this study. This report is considered highly confidential and the sole property of the customer. Reservoirs Environmental, Inc. will not discuss any part of this study with personnel other than those of the client. The results described in this report only apply to the samples analyzed. This report must not be used to claim endorsement of products or analytical results by NVLAP or any agency of the U.S. Government. This report shall not be reproduced except in full, without written approval from Reservoirs Environmental, Inc. Samples will be disposed of after sixty days unless longer storage is requested. If you have any questions about this report, please feel free to call 303-964-1986.

Sincerely,

Jeanne Spencer Orr

President

Laboratory Code: RES Subcontract Number: NA

Laboratory Report: RES 229474-1R
Project # / PO #: WA-000944-0160-10
Project Description: CDOT Region 1 HY 9

Lead

Aaron Ardourel Walsh Environmental - (Colo. Springs) 130 E. Kiowa Suite 202 Colorado Springs CO 80903

Dear Customer,

Reservoirs Environmental, Inc. is an analytical laboratory accredited for the analysis of Industrial Hygiene and Environmental matrices by the American Industrial Hygiene Association, Lab ID 101533 - Accreditation Certificate #480. The laboratory is currently proficient in both PAT & ELPAT programs respectively.

Reservoirs has analyzed the following sample(s) using Atomic Absorption Spectroscopy (AAS) / Atomic Emission Spectroscopy - Inductively Coupled Plasma (AES-ICP) per your request. Reported sample results were not blank corrected. The analysis has been completed in general accordance with the appropriate methodology as stated in the analysis table. Results have been sent to your office.

**RES 229474-1R** is the job number assigned to this study. This report is considered highly confidential and the sole property of the customer. Reservoirs Environmental, Inc. will not discuss any part of this study with personnel other than those authorized by the client. The results described in this report only apply to the samples analyzed. This report shall not be reproduced except in full, without written approval from Reservoirs Environmental, Inc. Samples will be disposed of after sixty days unless longer storage is requested. If you should have any questions about this report, please feel free to call me at 303-964-1986.

Sincerely,

Jeanne Spencer Orr

President

- Colorado Department of Public Health and Environment, Regulation 8 Emission Standards for Asbestos, 2003.

### **GLOSSARY**

- ASBESTOS A generic name given to a number of naturally occurring silicates that have a unique crystalline structure. They are incombustible in air and separable into fibers. Asbestos includes the asbestiform varieties of Chrysotile, Crocidolite, Amosite, Anthophyllite, Actinolite, and Tremolite.
- ACBM Asbestos-Containing Building Material. A term that encompasses surfacing, thermal system, and miscellaneous asbestos-containing material in or on interior/exterior parts of a building. This definition also included exterior hallways connecting buildings, porticos, and mechanical system insulation.
- ACBM Asbestos-Containing Building Material. Any material with one percent (1%) or more asbestos content.
- BULK SAMPLE A piece of suspected asbestos-containing building material.
- FRIABLE A material which can be crumbled, pulverized, or reduced to powder when dry, by moderate hand pressure.
- FUNCTIONAL AREA Distinct units within a building such as a room, a group of rooms, or a homogeneous area this includes crawl spaces and areas above a drop ceiling.
- HOMOGENEOUS AREA An area which appears similar throughout in terms of: color, texture, and date of material application.
- INACCESSIBLE AREA Inaccessible areas are those areas which cannot be inspected due to physical barriers. Buildings may contain areas that are intrinsically inaccessible. These include gaps and spaces in walls, areas above fixed ceilings and below floors, and enclosed boiler breechings and ducts. Some buildings contain other inaccessible areas, such as very small pipe tunnels, sealed crawl spaces, unsafe attics, encased boilers, etc.
- NON-FRIABLE A material which cannot be crumbled or pulverized by hand pressure.
- PACM Presumed Asbestos-Containing Material
- PLM Polarized Light Microscopy. An accepted method for analyzing bulk ACBM samples.
- RACM Regulated Asbestos-Containing Material. Any material with one percent (1%) or more asbestos content and is required to be removed prior to demolition activities.
- EPA United States Environmental Protection Agency. The EPA is the federal agency that governs environmental problems. In the case of ACBM in buildings, the EPA deals with regulations and their guidelines for application, renovation, removal, and disposal of ACBM in building structures.
