1.0 EXECUTIVE SUMMARY

CDOT is preparing to complete the US-550 / US-160 connection project through a design-build procurement method. The project will construct a four-mile section of US-550 from CR-302 to US-160 as shown in **Figure 2.1** through **2.3**. US-550 is currently a 2-lane highway in this area. It will be reconstructed as a 4-lane divided highway. The intersections at US-160 / US-550 and US-550 / CR-220 will also be reconfigured with this project.

This report was prepared to evaluate a potential construction phasing sequence and its impacts on mobility. Mobility Thresholds were identified to determine if a lane closure would be acceptable or not. For the purpose of this project, it was assumed that the following mobility thresholds were used:

- Level of Service (LOS) was assumed to be maintained at LOS D or better for the overall intersection and LOS E or better for individual approaches at impacted intersections during peak hours
- Travel Time impacts for out-of-direction travel was assumed to be less than 20 minutes.
- Queues were assumed to be maintained within existing storage.

Table 1.1 outlines the recommended allowed closures for this project.

Table 1.1: Recommended Allowed Closures

Closure	Allowed?
Long-Term Full Closure of Ramp B	Yes
Long-Term WB Lane Closure on US-160	No
Long-Term EB Lane Closure on US-160	No
Long-Term Full Closure on US-550	No
Long-Term Full Closure on CR-220	No
One-Lane Two-Way Operations on US-550	Yes ¹
Off-Peak Lane Closures (7 PM to 7 AM)	Yes

1. This lane restriction is allowed for distances of 2000' or less.

Language should also be included to mandate monitoring of traffic during construction.

2.0 INTRODUCTION

CDOT is preparing to complete the US-550 / US-160 connection project through a design-build procurement method. This Lane Closure Strategy Report evaluates the traffic constraints of lane closures at this location as well as identifies innovative strategies for construction phasing. This report will help CDOT determine appropriate lane closure restrictions to implement as part of the US-550 / US-160 Connection Design Build project.

The project will construct a four-mile section of US-550 from CR-302 to US-160 as shown in **Figure 2.1**. US-550 is currently a 2-lane highway in this area. It will be reconstructed as a 4-lane divided highway. The intersection at US-160/US-550 will also be relocated from its existing location and will connect with the Wilson Gulch interchange. A new roundabout intersection will be constructed south of US-160 at the interchange to accommodate this reconfiguration as shown in **Figure 2.2**. The intersection at US-550/CR-220 will also be realigned from a skewed “triangle” intersection to a more traditional intersection that is better aligned with US-550 as shown in **Figure 2.3**.

This report also proposes a concept for major construction traffic phases that is intended to establish a baseline concept for construction phasing. The proposers would be required to either comply with this overall approach, or recommend Alternative Technical Concepts (ATCs) that are equal to or better than the concept presented here-in. An evaluation of the impacts of the proposed closure strategy is also provided. The proposers would be required to meet or exceed the same thresholds identified in the analysis presented for approval of ATCs. It is recommended that mobility thresholds for the project be established to evaluate if ATCs are acceptable. For the purposes of this analysis, it was assumed that the following three mobility thresholds were in place:

- Travel Time: No detour would result in more than 20 minutes of out-of-direction travel
- Level of Service (LOS): All intersections would operate at LOS D or better for the overall intersection, and LOS E or better for individual approaches
- Queueing: All queues would fit within available storage

Glossary

Short-Term Closure: Any lane or roadway closure that is limited to off-peak periods.

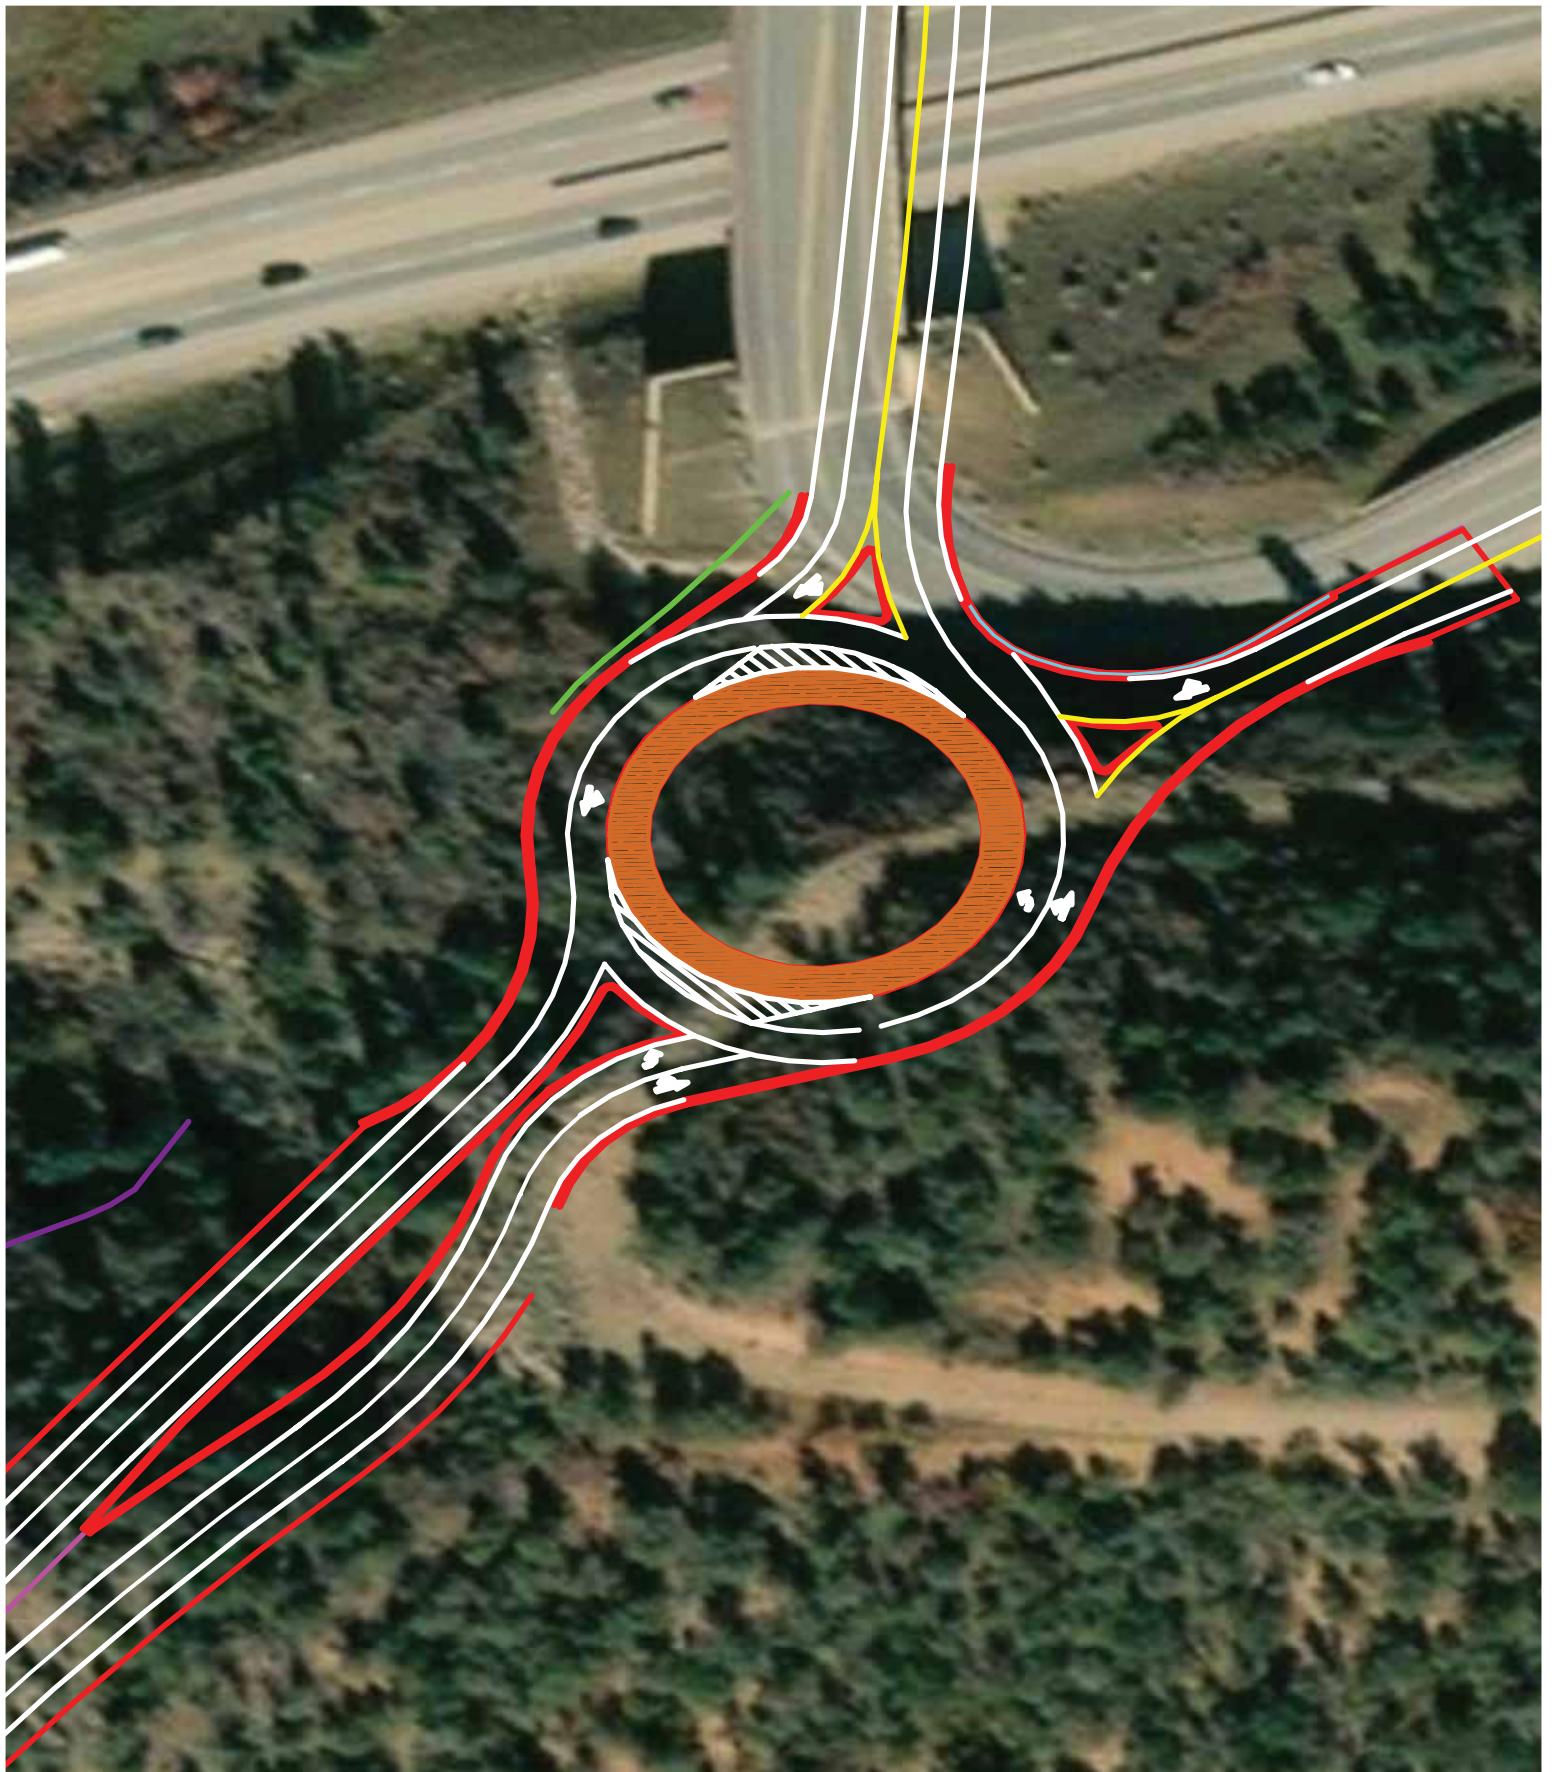

Long-Term Closure: Any lane or roadway closure that is allowed during peak periods.

Alternative Technical Concept (ATC): Concepts developed by the proposer that are determined by the owner to be equal to or better than the original concept, and therefore allowed within the proposers bid.

PROJECT OVERVIEW

Figure 2.3

3.0 METHODOLOGY

The transportation operations analysis addressed signalized and unsignalized intersection operations using the procedures and methodologies contained in the Highway Capacity Manual 2010 (HCM), Transportation Research Board for the weekday AM and PM peak hour traffic operations. Study intersection operations were evaluated using level-of-service calculations as analyzed in the Synchro software (Version 09).

3.1 LEVEL OF SERVICE

To measure and describe the operational status of the local roadway network and corresponding intersections, transportation engineers and planners commonly use a grading system called level-of-service (LOS) put forth by the Transportation Research Board's HCM 2010. LOS characterizes the operational conditions of an intersection's traffic flow; ranging from LOS A (indicating free flow traffic conditions with little or no delay) to LOS F (representing over-saturated conditions where traffic flows exceeds the design capacity, resulting in long queues and delays). These grades represent the perspective of drivers and are an indication of the comfort and convenience associated with driving. Although LOS A through C are desired levels, LOS D is considered acceptable. Traffic conditions with LOS E or F are generally considered unacceptable and represent significant travel delay, increased accident potential, and inefficient motor vehicle operation. The LOS is determined differently depending on the type of control at the intersection.

At signalized intersections, the operation analysis uses various intersection characteristics (such as traffic volumes, lane geometry, and signal phasing) to estimate the intersection's volume-to-capacity (v/c) ratio. For signalized intersections the HCM defines the intersection LOS as the average delay per vehicle for the overall intersection, which includes all approaches.

At unsignalized intersections, the operations analysis uses various intersection characteristics (such as traffic volumes, lane geometry, and stop-controlled approaches) to estimate the intersection's volume-to-capacity (v/c) ratio. For unsignalized intersections the HCM defines the intersection LOS as either the average delay per vehicle for the worst approach or the whole intersection for side-street stop and all-way stop intersections, respectively. **Table 3.1** summarizes the relationship between delay and LOS for signalized intersections and **Table 3.2** summarizes the relationship between delay and LOS for unsignalized intersections and roundabouts.

TABLE 3.1:
SIGNALIZED INTERSECTION LEVEL OF SERVICE DEFINITIONS
USING AVERAGE CONTROL VEHICULAR DELAY

Level of Service	Description	Average Control Delay Per Vehicle (Seconds)
A	Operations with very low delay occurring with favorable progression and/or short cycle lengths.	< 10.0
B	Operations with low delay occurring with good progression and/or short cycle lengths.	>10 to 20
C	Operations with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.	>20 to 35
D	Operations with longer delays due to a combination of unfavorable progression, long cycle lengths, and high V/C ratios. Many vehicles stop and individual cycle failures are noticeable.	>35 to 55
E	Operations with high delay values indicating poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences.	>55 to 80
F	Operations with delays unacceptable to most drivers occurring due to over-saturation, poor progression, or very long cycle lengths.	> 80

TABLE 3.2:
UNSIGNALIZED INTERSECTION AND ROUNDABOUT LEVEL OF SERVICE DEFINITIONS
USING AVERAGE CONTROL VEHICULAR DELAY

Level of Service	Description	Average Control Delay Per Vehicle (Seconds)
A	Little or no delay.	<10
B	Short traffic delay.	>10 to 15
C	Average traffic delays.	>15 to 25
D	Long traffic delays.	>25 to 35
E	Very long traffic delays.	>35 to 50
F	Extreme traffic delays with intersection capacity exceeded.	>50

Source: *Highway Capacity Manual (Transportation Research Board, 2010)*.

3.2 MOBILITY THRESHOLDS

Within the study area, CDOT uses LOS D or better as the acceptable LOS for both intersections and highway segments. Metrics that can be used to evaluate construction activities on mobility may include:

- Changes in LOS
- Changes in Travel Time
- Changes in Queue Lengths

3.2.1 LEVEL OF SERVICE

LOS is effective at assessing mobility impacts during construction as it is a commonly used metric that assess the traveler's experience. A weakness of this metric is that LOS is usually only defined for peak hour operations and does not capture the impacts of off-peak construction activities well. There are a variety of potential thresholds that could be implemented for this project such as:

- Maintain traffic conditions equal to or better than the existing LOS, or
- Allow impacts to LOS that don't exceed LOS D conditions, or
- Allow an increase in intersection delay up to 30%, but not to exceed LOS E conditions.

Further discussion with the project team and CDOT stakeholders should be completed to identify acceptable thresholds for LOS during construction. For this project, it is recommended that a lane closure would be acceptable as long as it didn't result in an intersection exceeding LOS D conditions overall or exceed LOS E for any individual approach during the peak hours.

3.2.2 TRAVEL TIME

Travel time is also a useful metric for measuring detour routes and out-of-direction travel. For the purposes of this evaluation, it is recommended that detour routes should not result in increases in travel time in excess of 20 minutes.

3.2.3 QUEUE LENGTHS

Queueing is also an important metric for evaluating traffic impacts during construction. Similar to LOS, this is often only evaluated for peak-hour impacts. This metric also relates to safety in the work-zone as increasing queues beyond available storage can result in queues spilling back into and blocking mainline traffic flow. For the purpose of this study, the allowed mobility threshold is that queues fit within available storage. If a queue is currently exceeding available storage, it was assumed that the construction activities should not increase the queue length without providing mitigations.

4.0 DATA COLLECTION

Twenty-four hour traffic volume counts were conducted for a one-week period at the following locations including classification data:

- US-160 west of the existing intersection at US-550
- US-160 east of the future US-550 interchange (west of CR-232)
- US-550 south of US-160
- CR-220 east of US-550

Peak hour traffic volume counts were conducted on a weekday at the following intersections:

- US-160/US-550
- US-550/CR-220
- Wilson Gulch Dr.

Data available from the following three adjacent Automatic Traffic Recorders (ATRs) were evaluated:

- ATR Station 000257 on SR-550 near the border with New Mexico
- ATR Station 000217 on US-160 near Bayfield
- ATR Station 104809, MP 83.2 on US-160 near Santa Rita Park

These counts were conducted on a weekday from middle to end of September, which is representative of "summer time" traffic conditions. An additional count was conducted on a weekday at the following intersection:

- SH 172/CR 220

This count was conducted in December and represents "winter time" traffic conditions. In order to complete the analysis presented in this report, winter counts were increased by a seasonal adjustment factor of 15% to convert them to summer. For winter analysis, the summer counts were reduced by 15% to convert them to winter. All traffic counts are available in **Appendix A**.

5.0 EXISTING CONDITIONS

Existing conditions within the study area were evaluated based on the following three features:

- Peak hour intersection turning volumes
- Peak hour intersection LOS
- Daily Traffic Volume Peaking characteristics

5.1 PEAK HOUR INTERSECTION TURNING VOLUMES

Figure 5.1 and **Figure 5.2** show the study intersections with summer and winter peak-hour traffic volumes.

5.2 PEAK HOUR INTERSECTION LOS

The existing operations of the study intersections were evaluated for the highest one-hour volumes during the weekday morning (AM Peak) and evening (PM peak) peak periods. The operations model included the existing roadways, intersection geometry, traffic control, and existing traffic. Analysis included assessing the intersection delay and LOS performance for each of the studied intersections.

According to the traffic volume counts, the AM Peak period is from 7:30 am to 8:30 am and the PM Peak period is from 4:30 pm to 5:30 pm. **Table 5.1** and **Table 5.2** provide the results of the capacity analysis of the Existing Conditions for the AM and PM peak hours assuming current geometry and traffic control. **Appendix B** provides the LOS reports for the Existing Conditions.

			WB	13.1	B	13.5	B
			NB	0.3	A	0.5	A
			SB	0.5	A	0.6	A

Notes

1. Signal = signalized intersection; SSSC = Side Street Stop Controlled intersection. For Side street Stop Controlled Intersections, intersection LOS is based on worst approach.
2. Whole intersection weighted average control delay expressed in seconds per vehicle for signalized intersections. At side-street-controlled intersections, the delay and LOS for the worst case movement is reported.

The results indicate that all study intersections operate at acceptable service levels during the AM and PM peak hours under Existing Conditions

TABLE 5.2: EXISTING CONDITIONS INTERSECTION LEVEL OF SERVICE RESULTS (WINTER COUNTS)

ID	Intersection	Control	Approach	AM		PM

			WB	13.2	B	12.2	B
			NB	0.3	A	0.4	A
			SB	0.5	A	0.6	A

Notes

3. Signal = signalized intersection; SSSC = Side Street Stop Controlled intersection
4. Whole intersection weighted average control delay expressed in seconds per vehicle for signalized intersections. At side-street-controlled intersections, the delay and LOS for the worst case movement is reported.

The results indicate that all study intersections operate at acceptable service levels during the AM and PM peak hours under Existing Conditions.

5.3 DAILY TRAFFIC VOLUME PEAKING CHARACTERISTICS

The average weekday volumes along US-160, US-550 and CR-232 are illustrated in **Figures 5.3** through **5.6**.

Fig 5.3: US-160 West of US-550 Average Weekday Volume

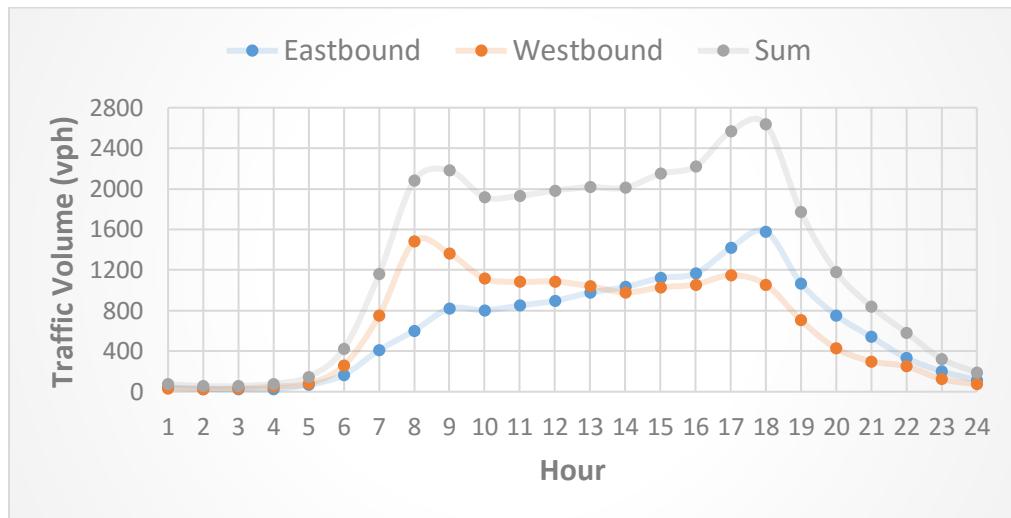

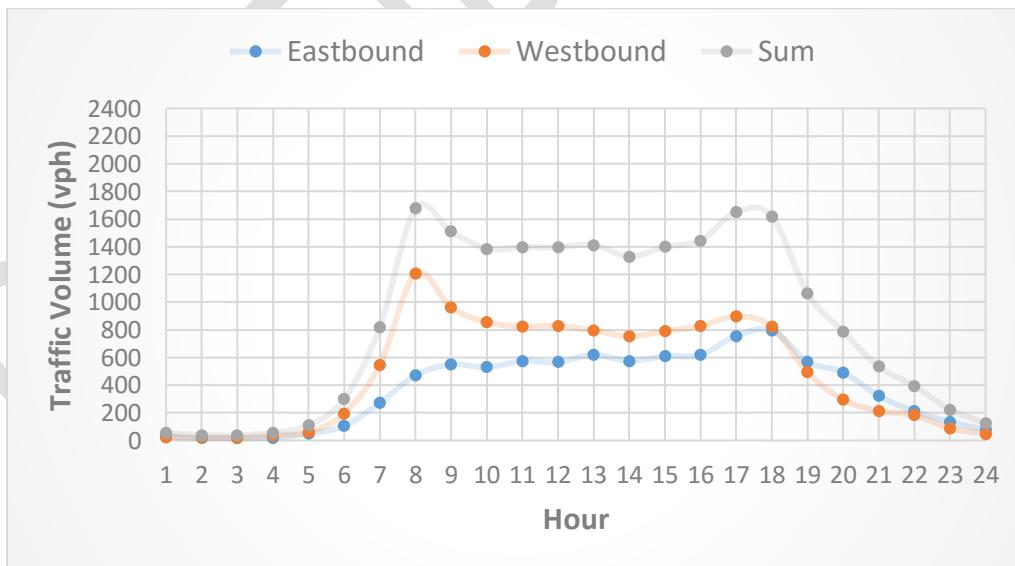

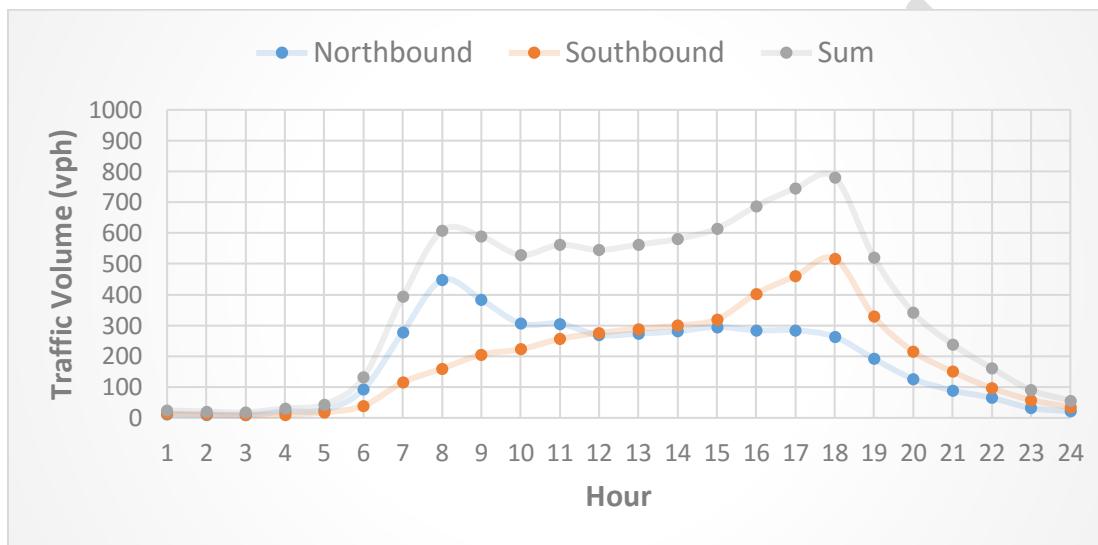

Fig 5.4: US-160 West of CR-232 Average Weekday Volume

As shown on **Figures 5.3** and **5.4**, traffic volumes on US-160 peak between 7:00 AM and 7:00 PM and reach a maximum flow rate of almost 1700 vph. This time period should be avoided for short-term lane closures or other construction activities. Volumes are lower than 400 vph total between 10:00 PM and 6:00 AM.

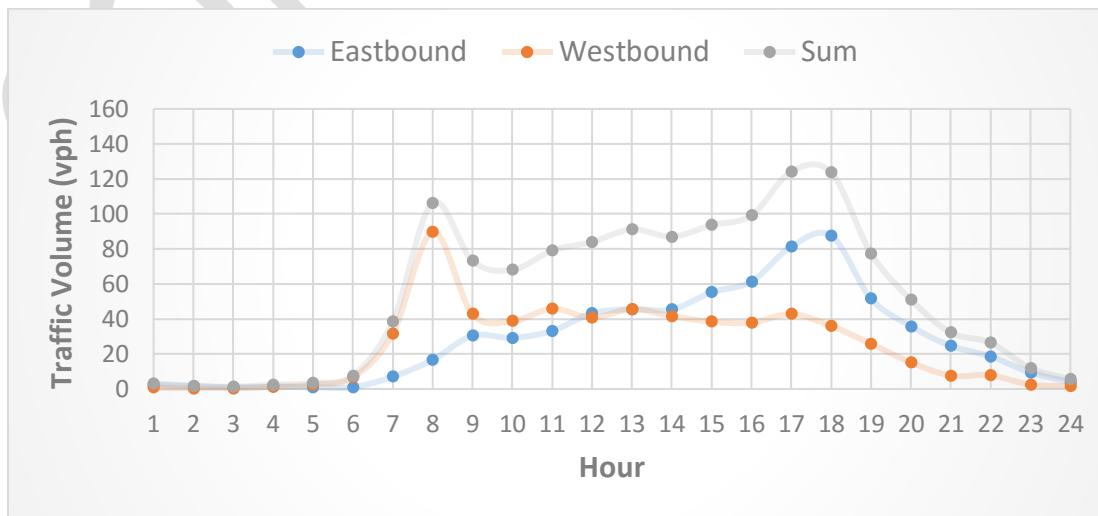

Construction activities during this time period would result in much less severe impacts to traffic flow. US-160 does not have much adjacent residential development immediately adjacent to the highway, which reduces the concern about noise impacts during this time period. The entirety of the project is within La Plata County boundaries, so additional coordination with the County should be considered to discuss any additional noise concerns.

Fig 5.5: US-550 South of US-160 Average Weekday Volume

As shown on **Figure 5.5**, traffic peaking on US-550 is similar to US-160 in that traffic tends to peak between 7:00 AM and 7:00 PM and reaches a maximum of 800 vph. However, the overall traffic volumes are much lower on US-550. Traffic volumes are less than 100 vph total between 11:00 PM and 6:00 AM.

Fig 5.6: CR-220 east of US-550 Average Weekday Volume

As shown on **Figure 5.6**, traffic volumes are even lower on CR-220. Peaks are still between 7:00 AM and 7:00 PM, with volumes less reaching a maximum of 130 vph. Volumes are less than 20 vph between 11:00 PM and 6:00 AM.

If short-term off-peak closures are necessary for construction, they should be limited to coincide with the time period when traffic volumes are lowest, which is 11:00 PM until 6:00 AM.

Long-term closures of any of these facilities would impact the following volume of traffic:

- US-160 long-term closures would impact 20769 daily trips
- US-550 long-term closures would impact 8874 daily trips
- CR-220 long-term closures would impact 1292 daily trips

6.0 MAINTENANCE OF TRAFFIC ANALYSIS

6.1 INTRODUCTION

For this analysis, it was assumed that the project would be broken into the following logical segments as shown in **Figure 6.1:**

- Segment 1: Station 810+00 to 865+00
- Segment 2: Station 865+00 to 880+00
- Segment 3: Station 880+00 to 975+00
- Segment 4: Station 975+00 to 987+00
- Segment 5: Station 987+00 to 1040+87

The MOT analysis was completed in three steps:

- 1) Determine a logical phasing scheme for the project, and
- 2) Evaluate what the traffic impacts of that phasing scheme may be
- 3) Recommend constraints and limitations on lane closures.

6.2 ANTICIPATED CONSTRUCTION PHASING

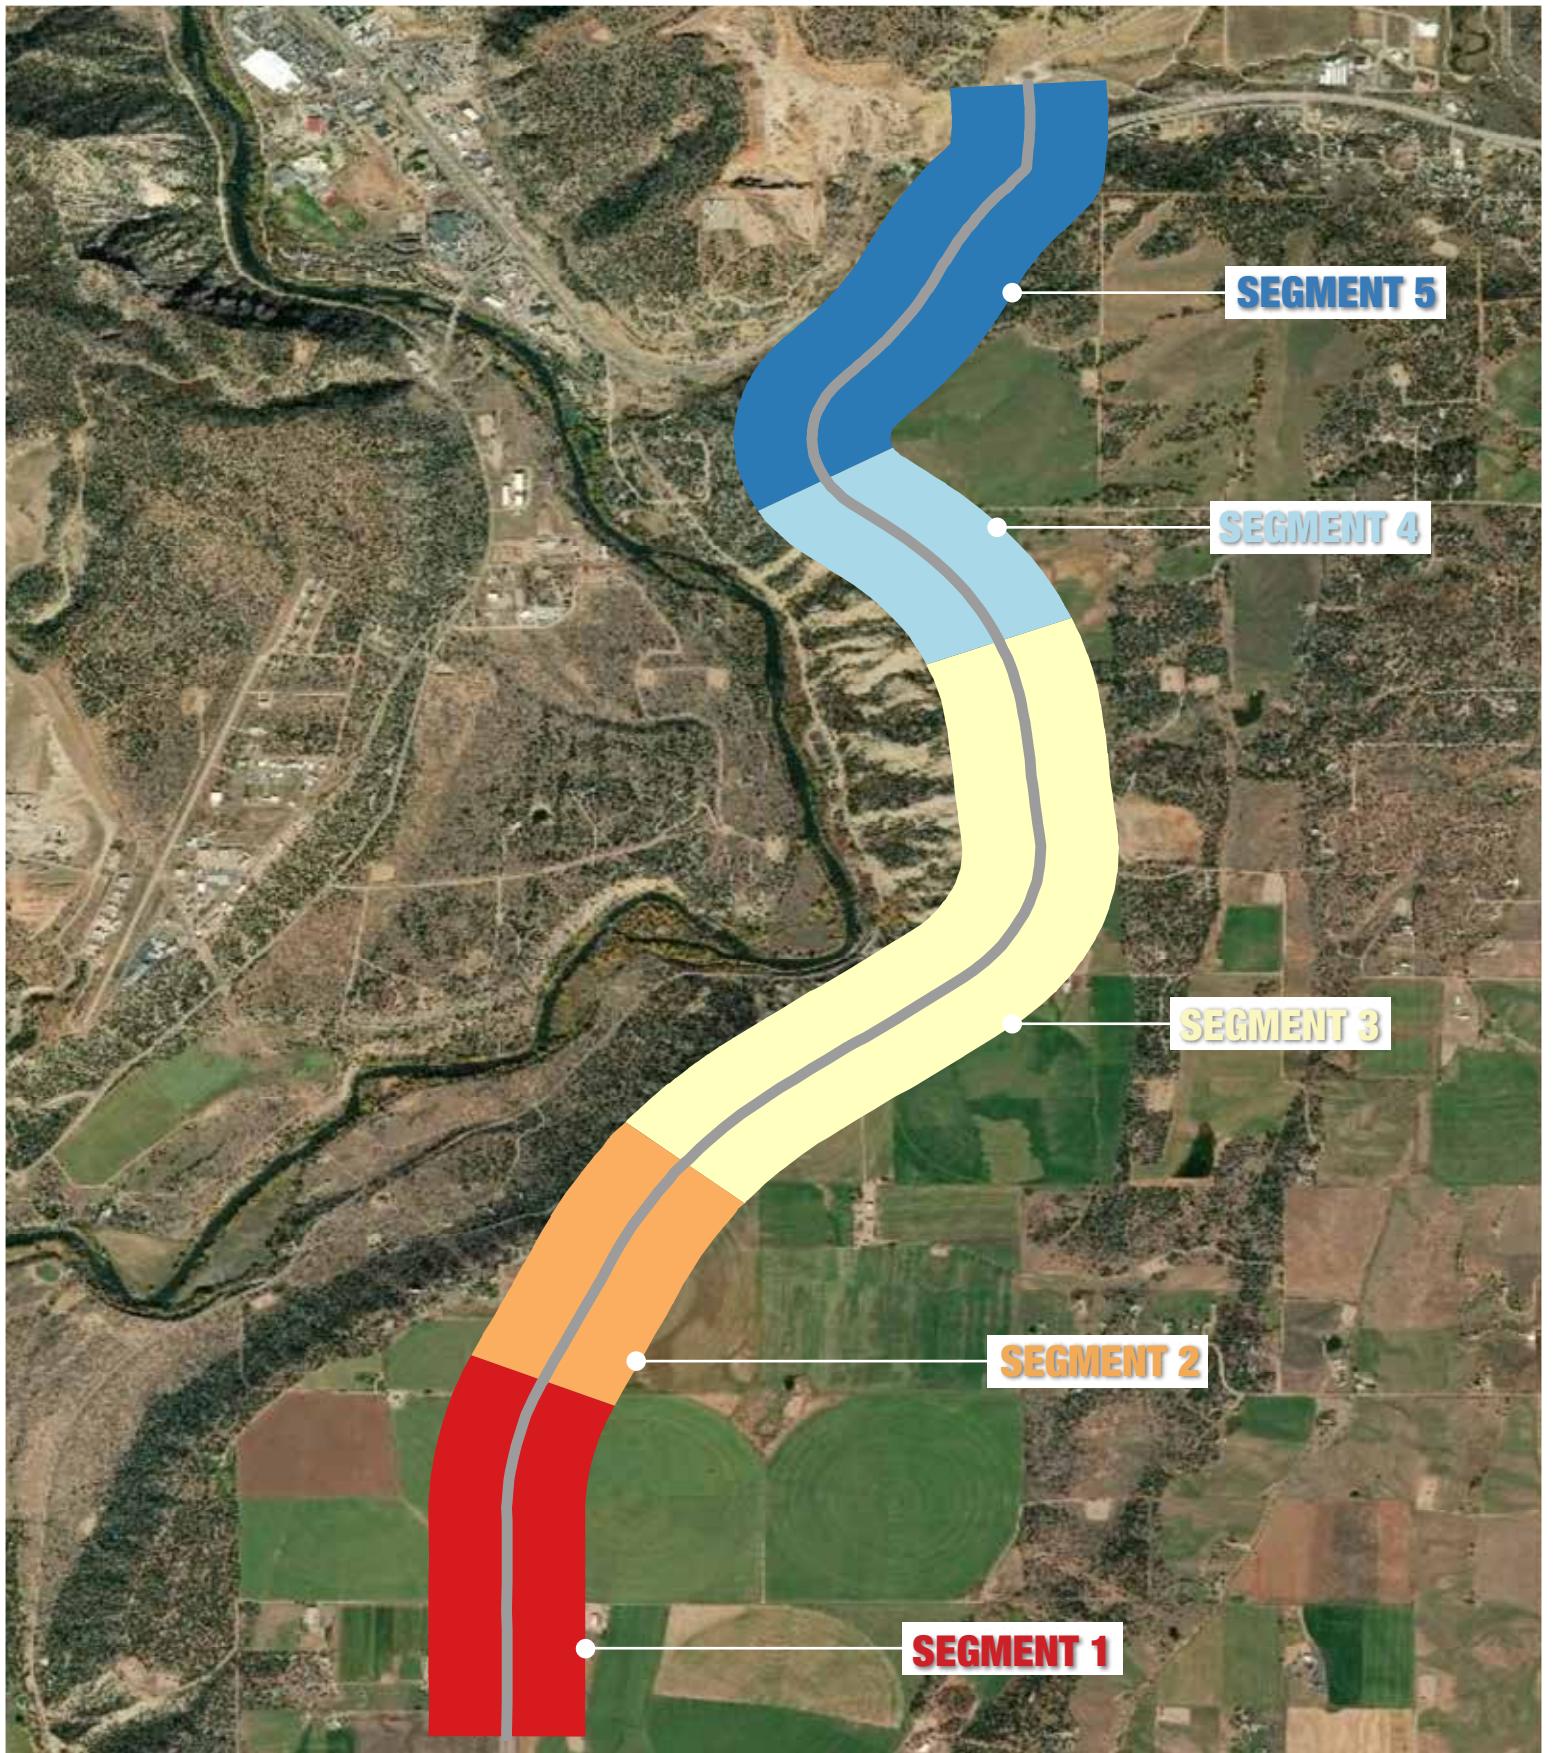

The following sections present our proposed phasing/stages for construction. This is expected to facilitate efficient traffic mobility during the construction. The bidders would be required to develop an Alternative Technical Concept (ATC) which is equal to or better than what is proposed in this report.

6.2.1 SEGMENT 1

This area is from the south end of the project near the 12 Mile Road intersection to a private driveway near Station 865+00. Within Segment 1, the eastern ½ of the proposed roadway is outside of the limits of the existing corridor. This segment could be constructed in two major traffic phases as shown in **Figure 6.2:**

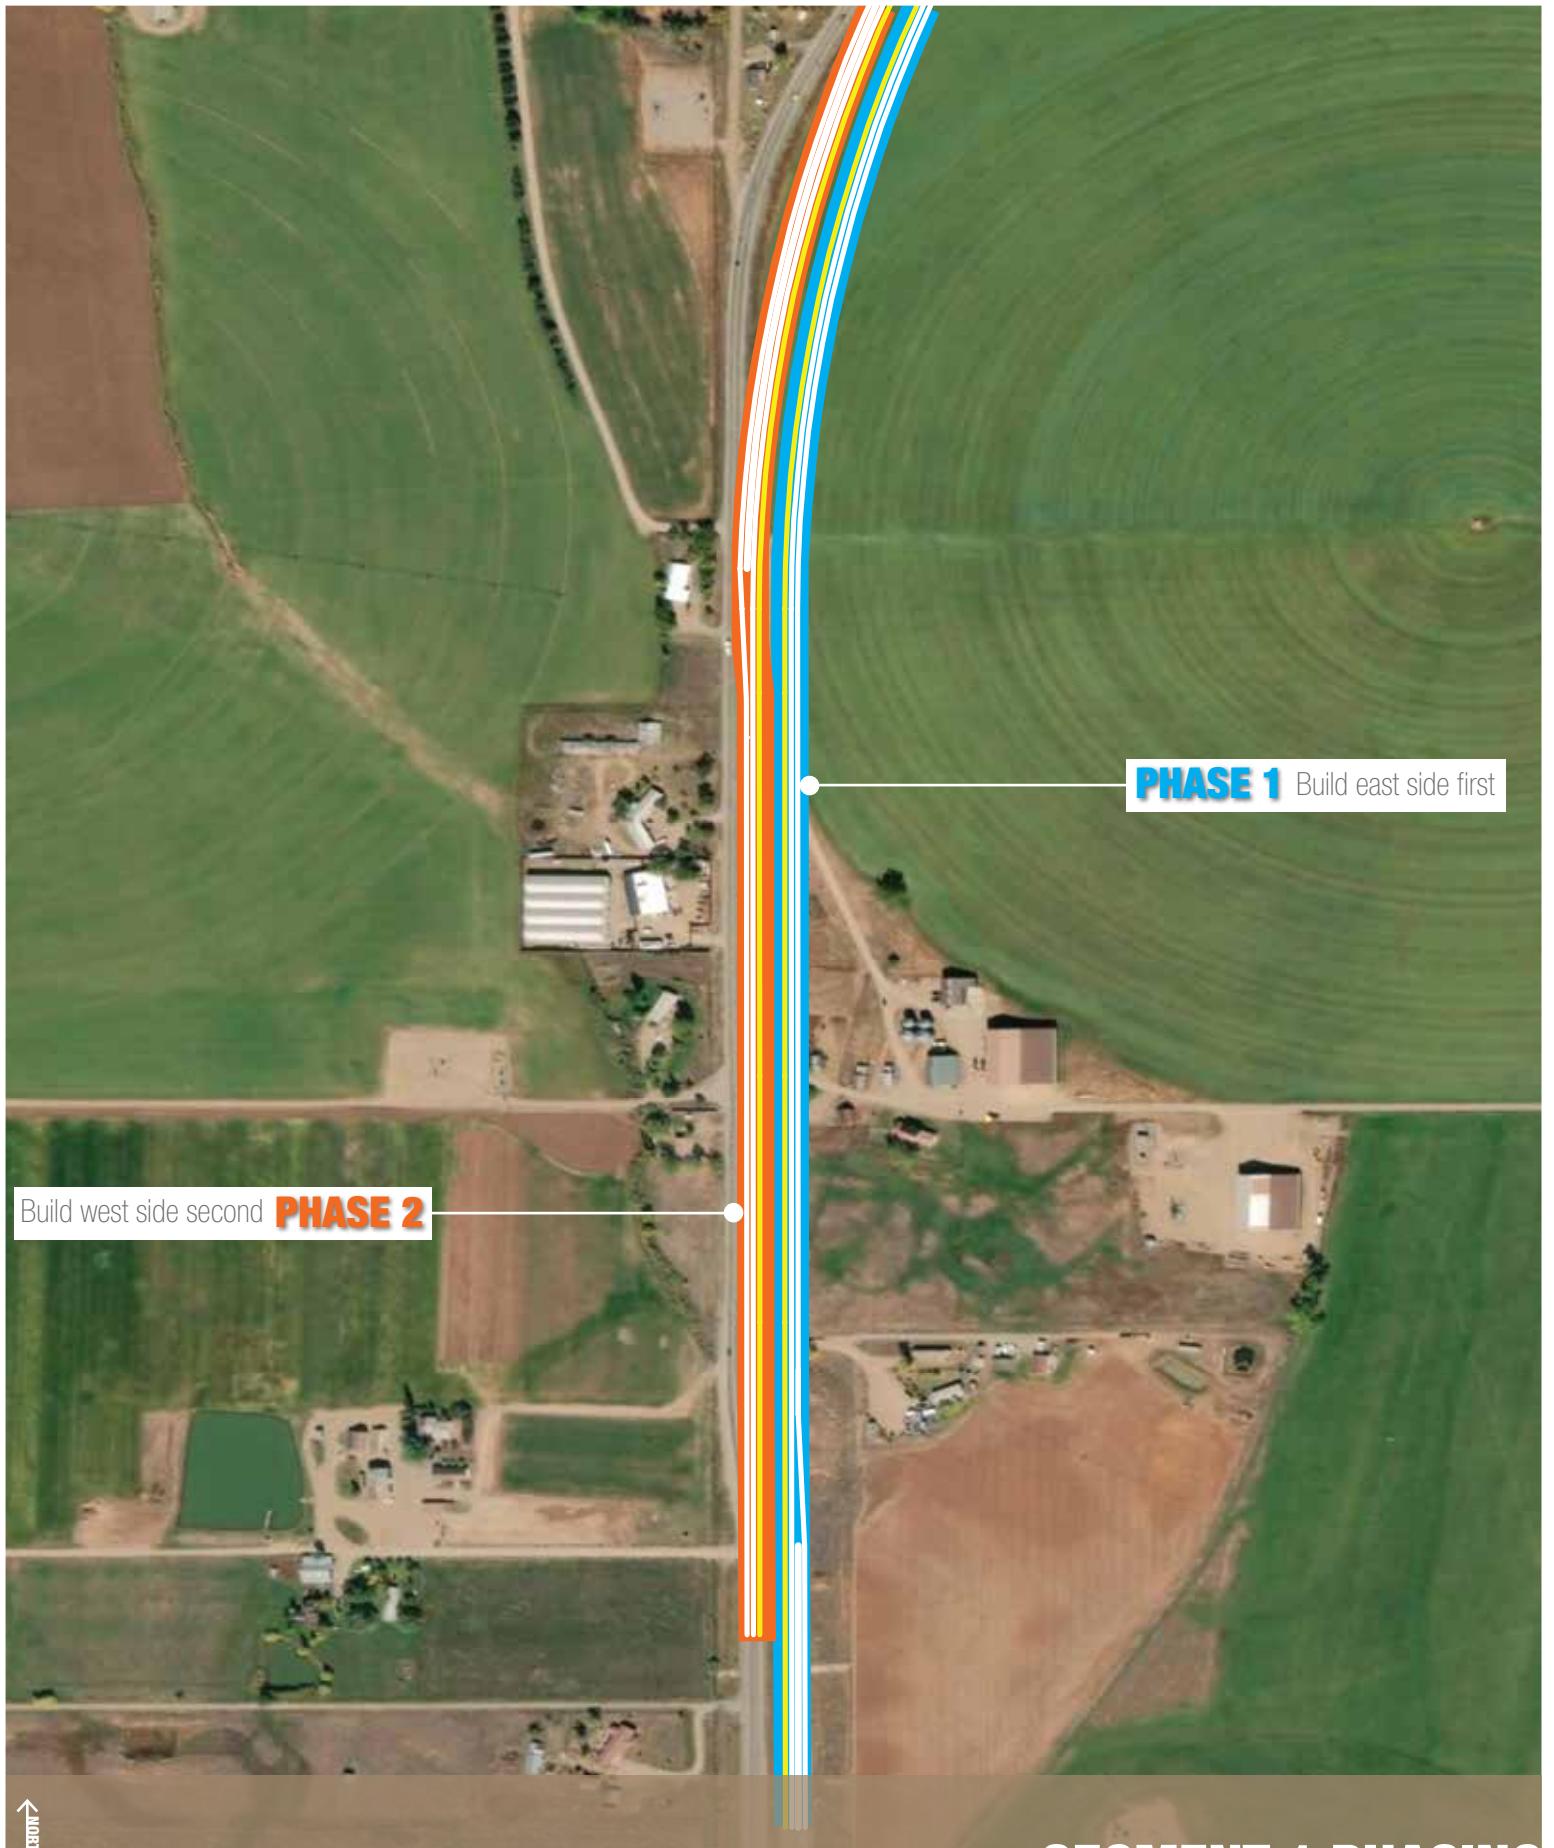

- Phase 1: Construct the eastern portion of the new highway, while maintaining traffic on the existing corridor.
- Phase 2: Shift both directions of traffic to the newly constructed eastern half of the highway and construct the new western portion.

Upon completion of these two phases, traffic could be shifted into its final configuration. This segment should be able to be constructed without implementing any long-term closures.

SEGMENT OVERVIEW

Figure 6.1

SEGMENT 1 PHASING

Figure 6.2

6.2.2 SEGMENT 2

This area is from the private driveway near Station 865+00 to the intersection of Bardin Dr. (CR-219). Within Segment 2, the proposed highway alignment transitions back and forth over the current roadway. Due to this complication, this segment of the project will require a more complicated construction approach. This segment could be constructed in these major traffic phases as shown in **Figure 6.3**:

- 1) Phase 1: Construct the eastern or western half of the corridor wherever it does not conflict with the current configuration, while maintaining traffic on the existing corridor.
- 2) Phase 2: Shift traffic onto the newly constructed pavement, while constructing the remaining pavement. This will require temporary pavement (cross-over points) between the eastern and western halves of the roadway at several locations.
- 3) Phase 3: Clean-up the areas where the temporary pavement was required and tie the portions of highway constructed in Phases 1 and 2 together.

Upon completion of these three phases, traffic could be shifted to its final configuration. Construction and implementation of the temporary cross-overs may require slightly longer closures, as may the tie-ins during Phase 3.

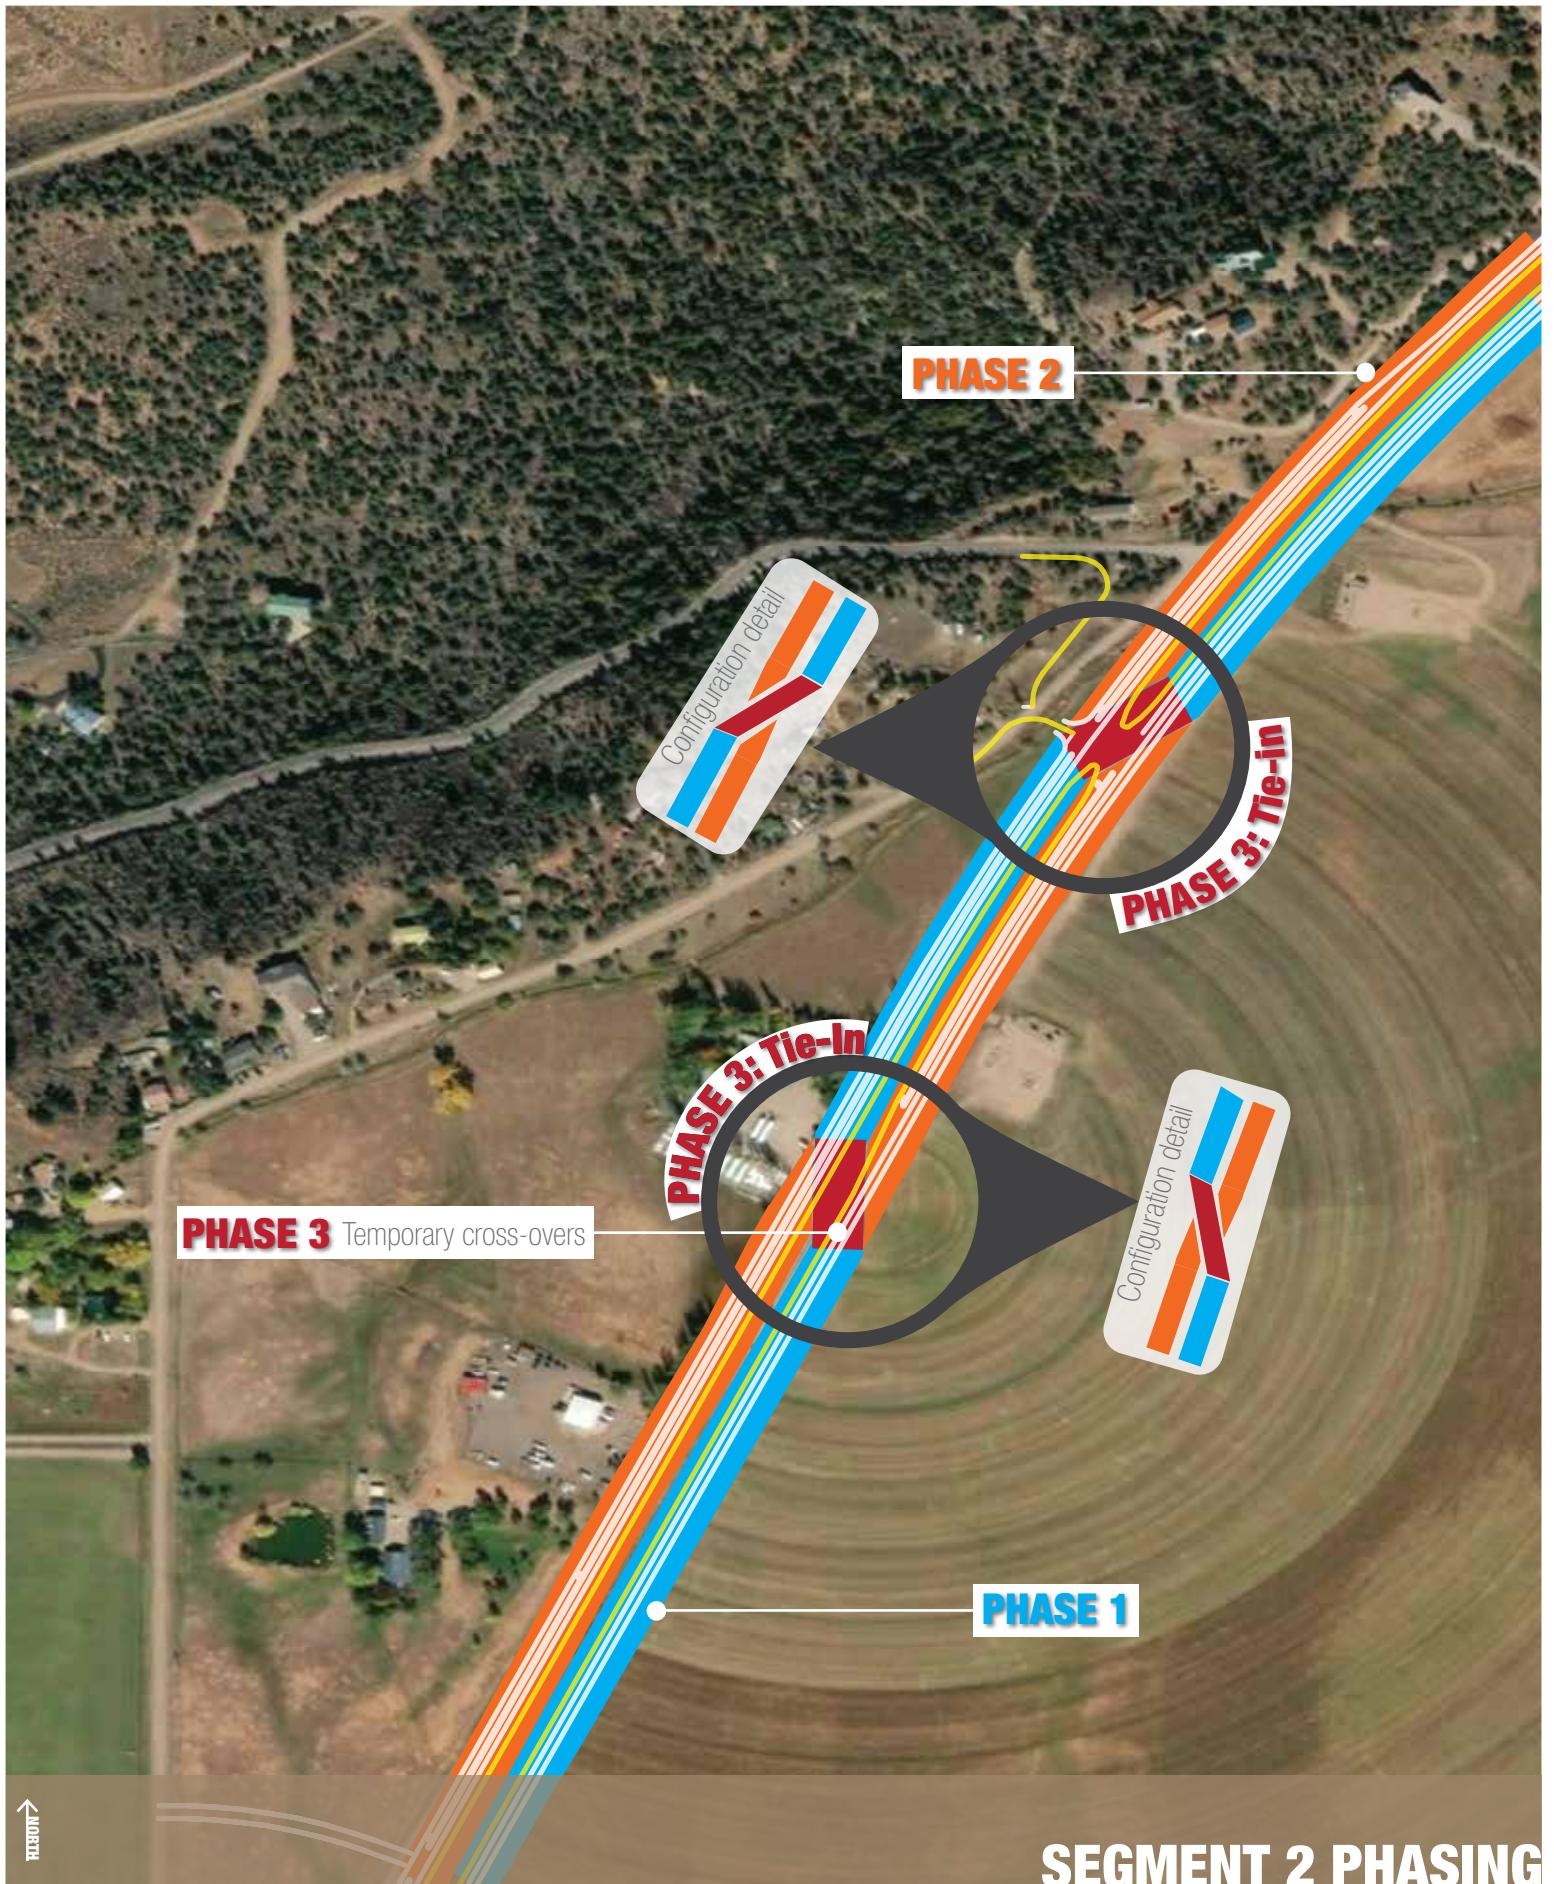

6.2.3 SEGMENT 3

This area is from the intersection of Bardin Dr. (CR-219) to just south of CR-220. Similar to Segment 1, the eastern portion of the new highway is completely outside of the existing alignment. Construction phasing in this area could be consistent with impacts in Segment 1, and no long-term closures are needed.

6.2.4 SEGMENT 4

This area is immediately adjacent to CR-220 and will require temporary cross-overs similar to Segment 2 along with a sub phase to deal with the CR-220 intersection reconfiguration. This segment could be built in three major phases as shown in **Figure 6.4**:

- Phase 1: Construct the western portion of the new highway as well as the frontage road to the west of the new alignment. All traffic would be maintained along the existing highways during this phase.
- Phase 2: Traffic on SR-550 would be shifted to the newly constructed pavement on the west side of the new highway. CR-220 would need to be temporarily maintained at the primary intersection with SR-550 during this phase. The eastern leg of the SR-550 / CR-220 intersection

SEGMENT 2 PHASING

Figure 6.3

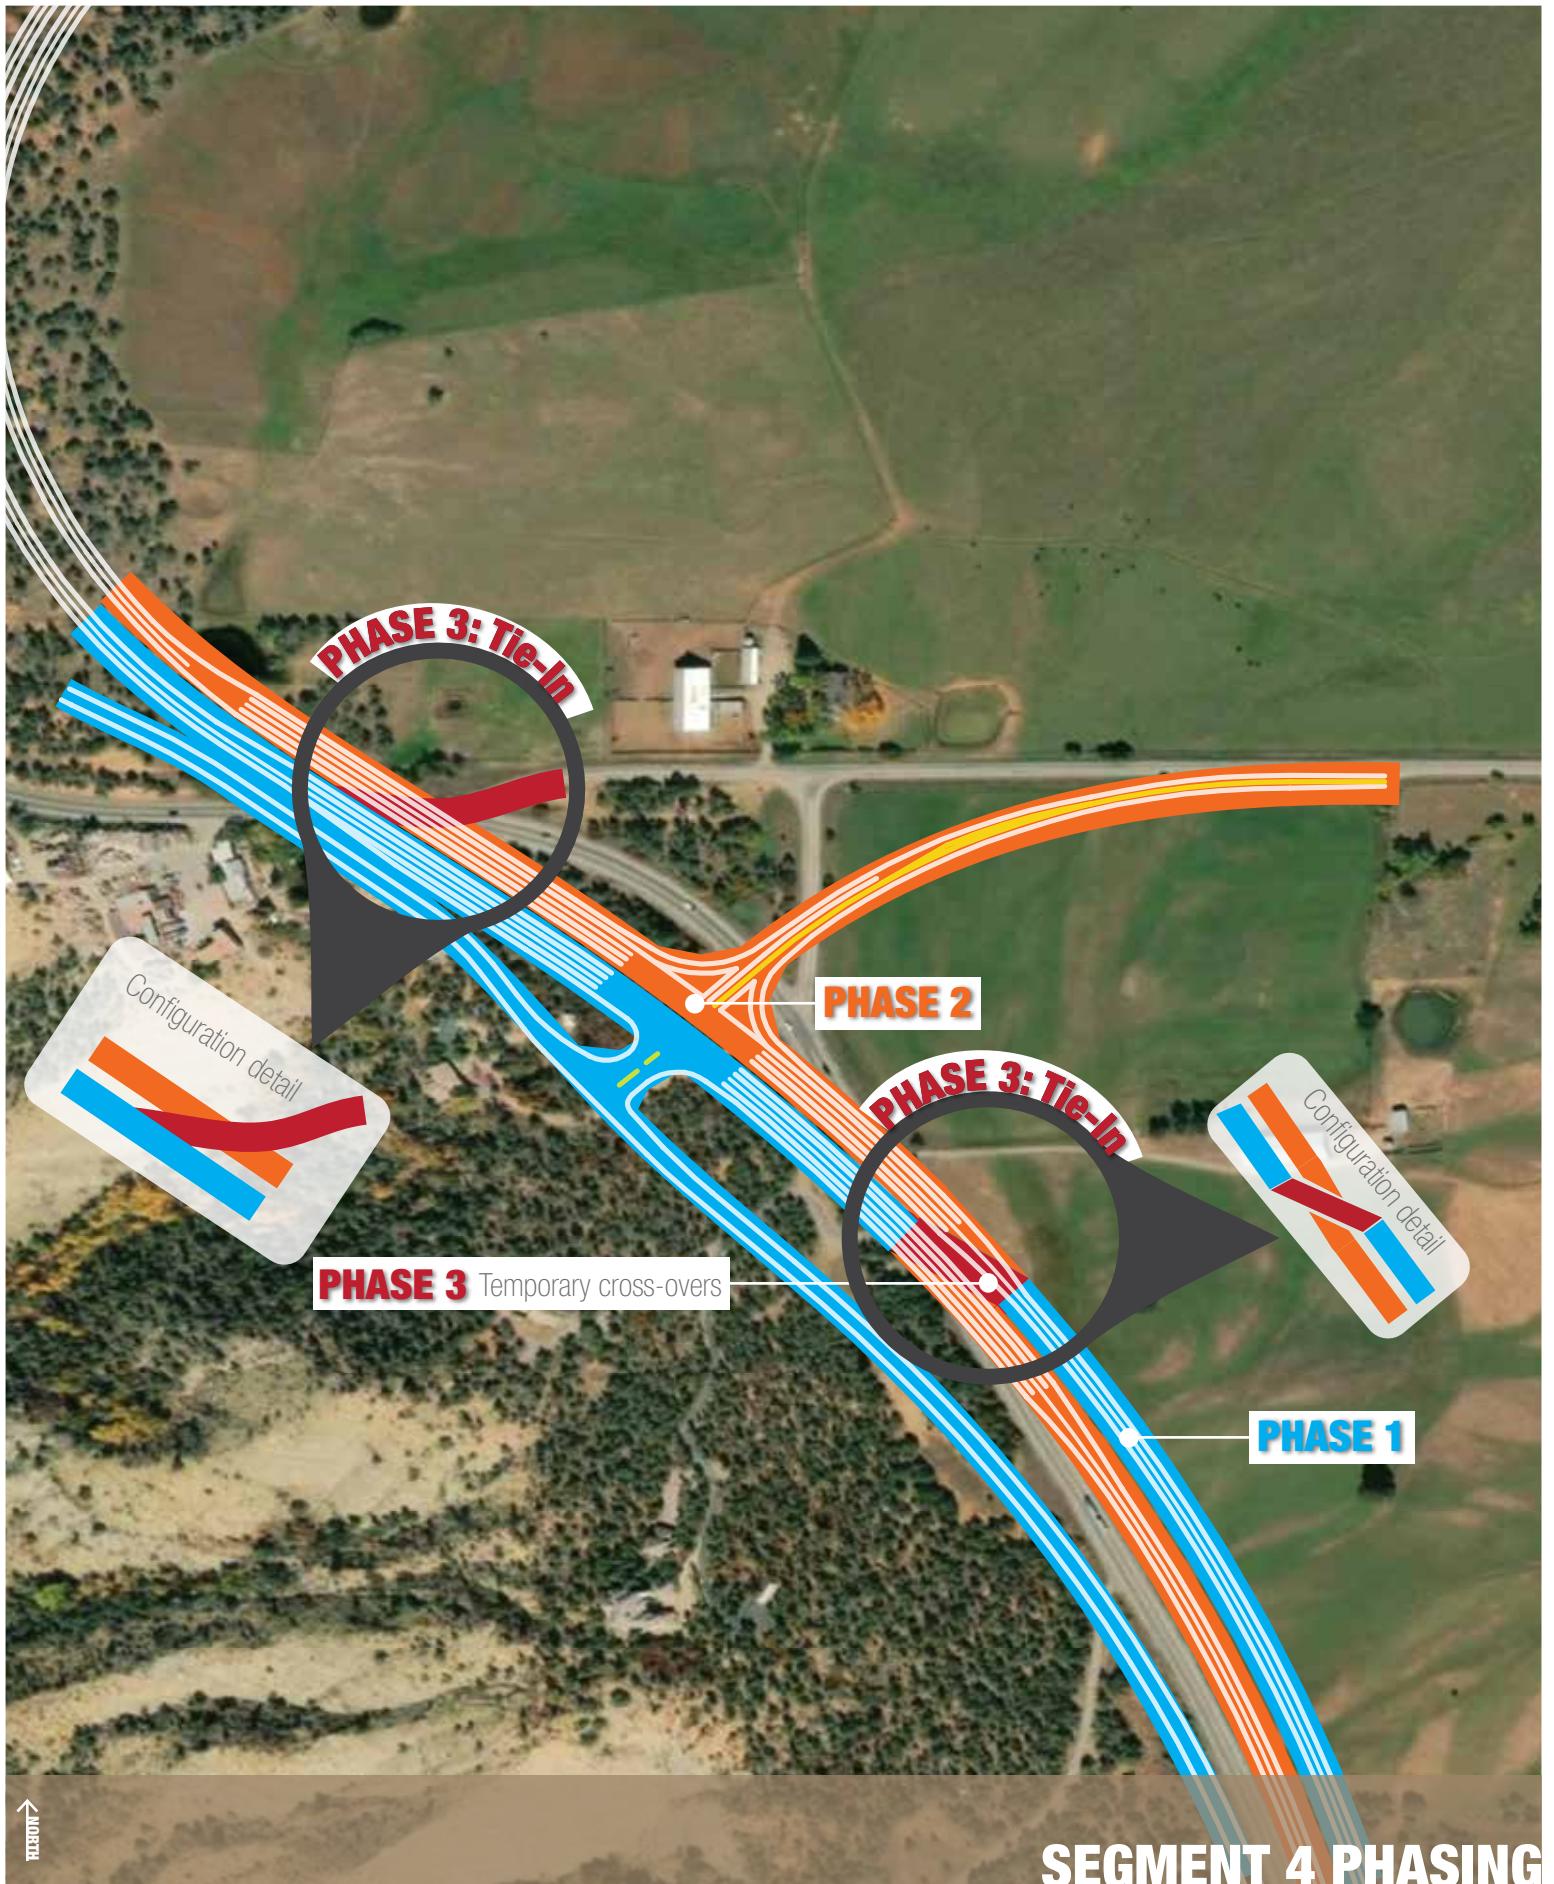

Figure 6.4

"triangle" would be closed during this time to facilitate construction of the new CR-220 alignment.

- 4) Phase 3: Clean-up the areas where the temporary pavement was required and tie the portions of highway constructed in Phases 1 and 2 together.

Upon completion of these three phases, traffic could be shifted to its final configuration. Construction and implementation of the temporary cross-overs may require slightly longer closures, as may the tie-ins during Phase 3.

6.2.5 SEGMENT 5

This area is primarily outside of the limits of the existing highway and should be able to be mostly constructed in a single phase. However, construction of the new roundabout at the US-160/US-550 interchange will have some impacts on traffic. Specifically, it is anticipated that construction activities may impact traffic operations on mainline US-160 due to construction staging below the interchange. It is also anticipated that construction may require closing Ramp B on the existing 550 bridge over 160 for the duration of construction as shown in **Figure 6.5**. See the Traffic Analysis section below for details on these impacts. Segment 5 also contains the existing intersection at US-160 / US-550 which will need to be abandoned with this project. This construction activity is also expected to have a potential impact on traffic.

6.2.6 OTHER CONSIDERATIONS

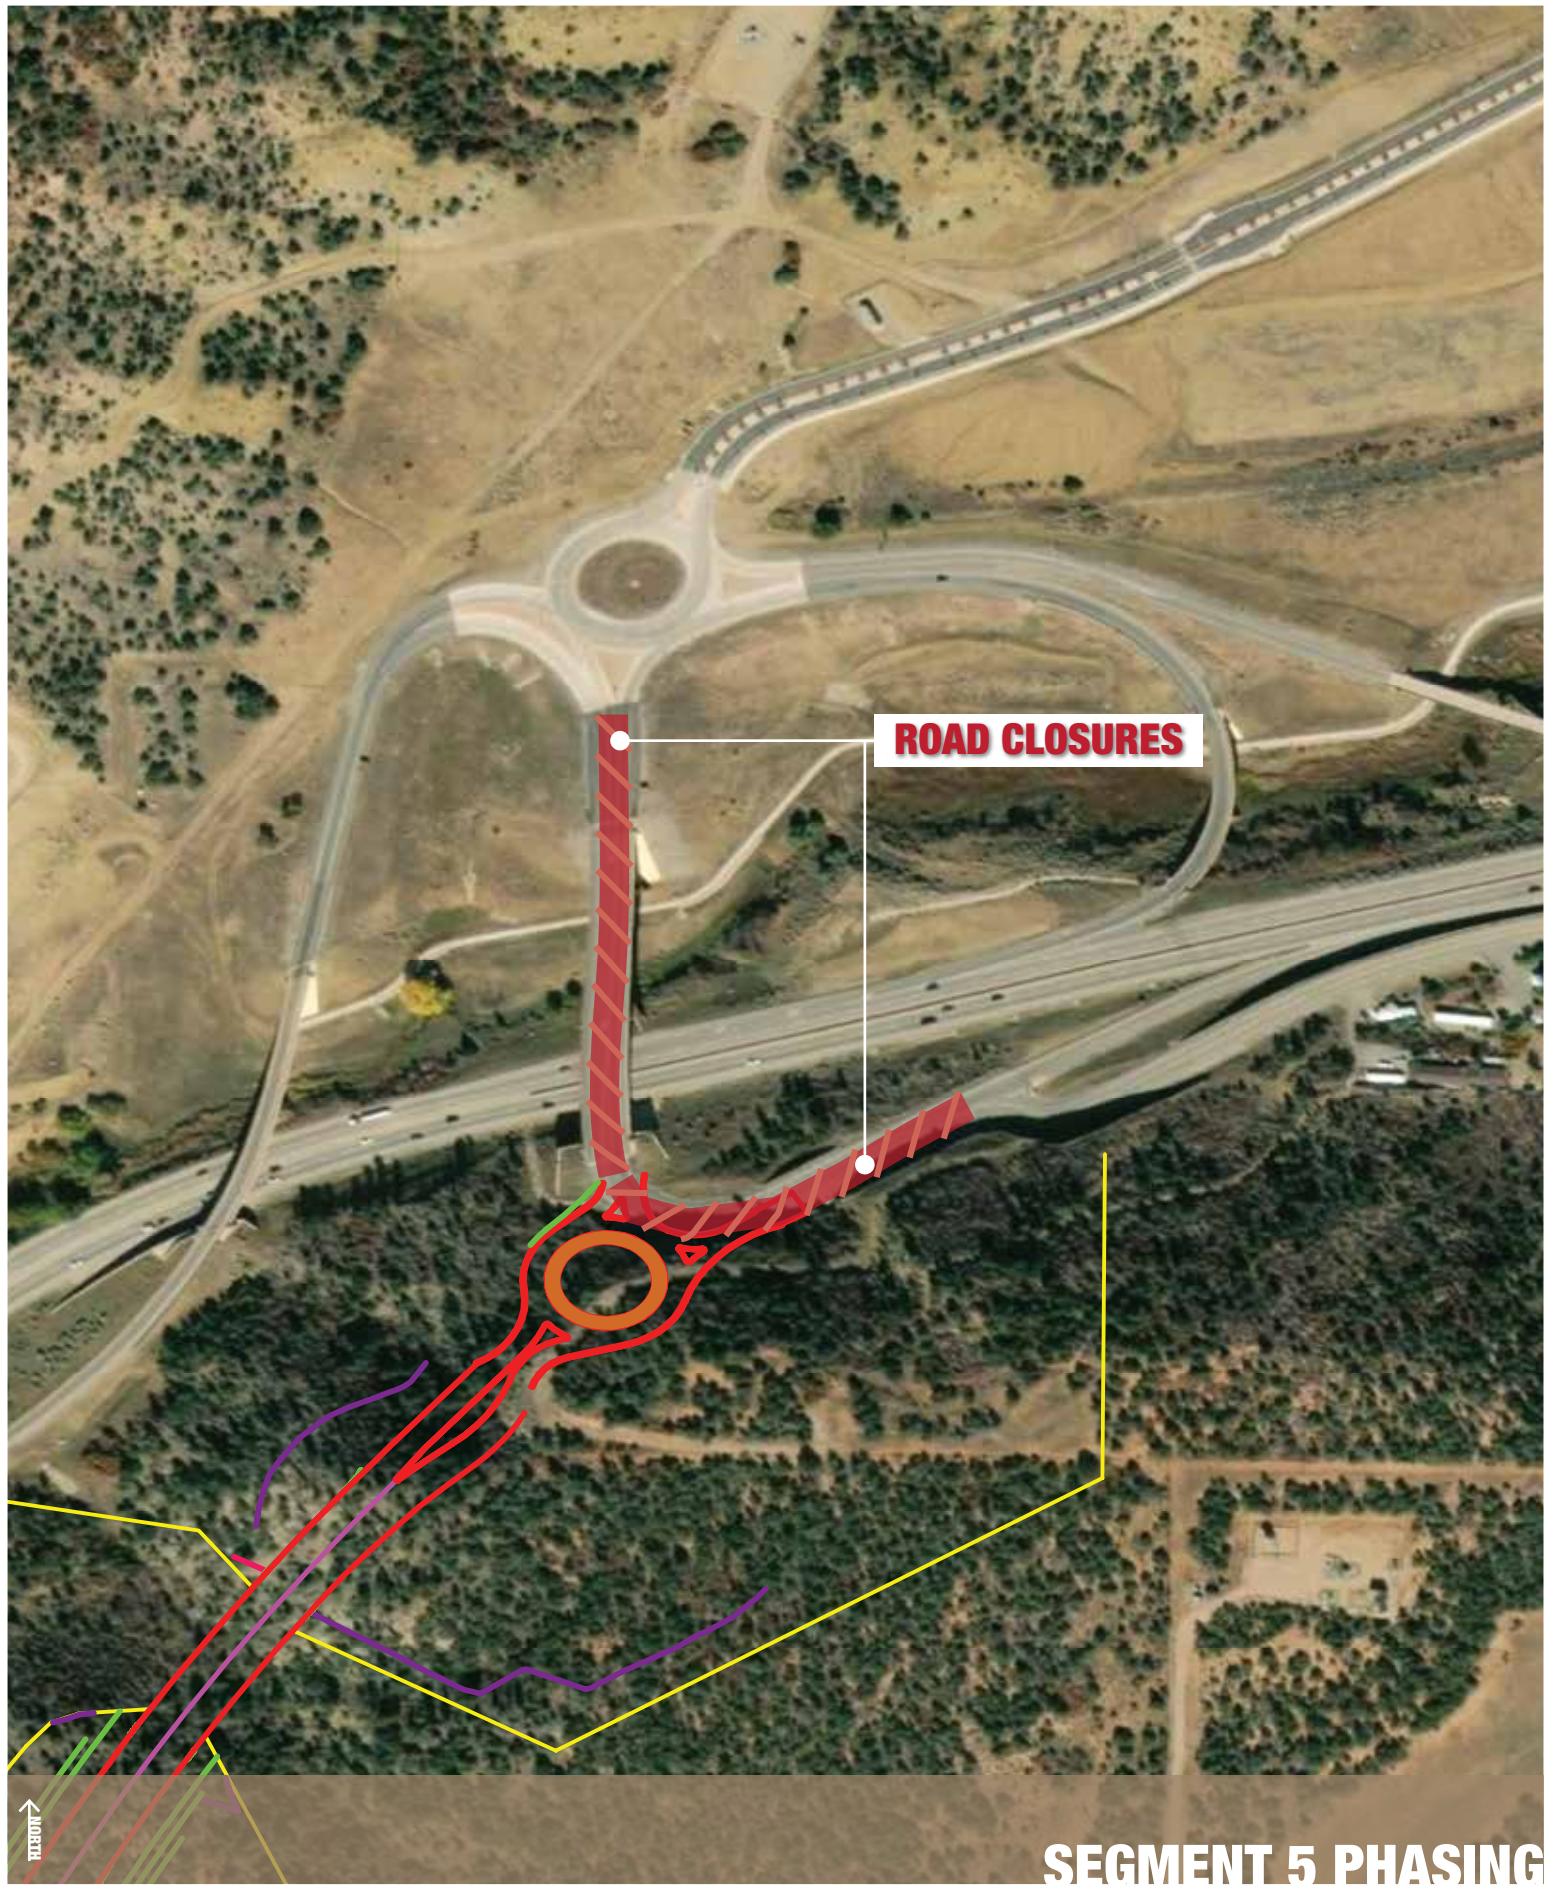

While the construction phasing presented does not necessarily require long-term full closures of US-550 or CR-220, allowing these closures may enable accelerated construction or expanded scope due to better use of resources. For this reason, long-term closures of these two facilities are analyzed as presented below.

6.3 TRAFFIC ANALYSIS

The first step in analyzing potential traffic impacts is to evaluate how any full roadway closures may impact mobility during construction. An evaluation of potential detour routes was considered if any long-term full roadway closures are needed.

6.3.1 RAMP B CLOSURE

It is anticipated that Ramp B at the existing US-160 / Wilson Gulch interchange will need to be closed during construction as shown in **Figure 6.4** to facilitate demolition of the existing shotcrete wall and excavation for construction of the new roundabout. This will require detouring traffic that is currently using this ramp. Fortunately the traffic volumes on the ramp are not significant and should be able to be detoured without major disruption to area mobility. The proposed detour route during closure of this ramp would impact two

SEGMENT 5 PHASING

Figure 6.5

movements: eastbound right turning vehicles and southbound through vehicles at the US-160 / Wilson Gulch interchange. There are no westbound left-turning vehicles at the interchange.

The eastbound right turning and southbound through vehicles travel along Ramp B for two possible routes: 1) Route to EB US-160 and 2) Route to CR-232. Let's assume that all of the eastbound right traffic are routed to CR-232, 80% of the southbound traffic are routed to EB US-160 and 20% of the southbound traffic are routed to CR-232 after Ramp B Closure

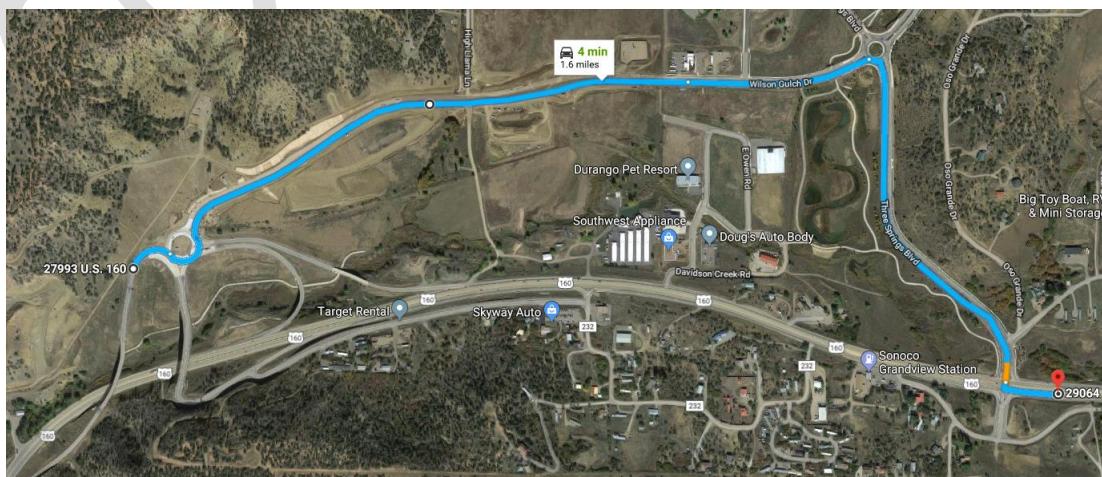

A potential detour for these two movements would be taking the Eastbound Wilson Gulch Drive and then taking a right on to Three Springs Blvd, which provides access to US-160. In the AM peak period, 33 vehicles will need to be rerouted and in the PM peak period, 58 vehicles will need to be rerouted.

The original route and the detours along these two possible routes are shown below:

Fig 6.5: Original Route to EB US-160

Fig 6.6: Detour to EB US-160

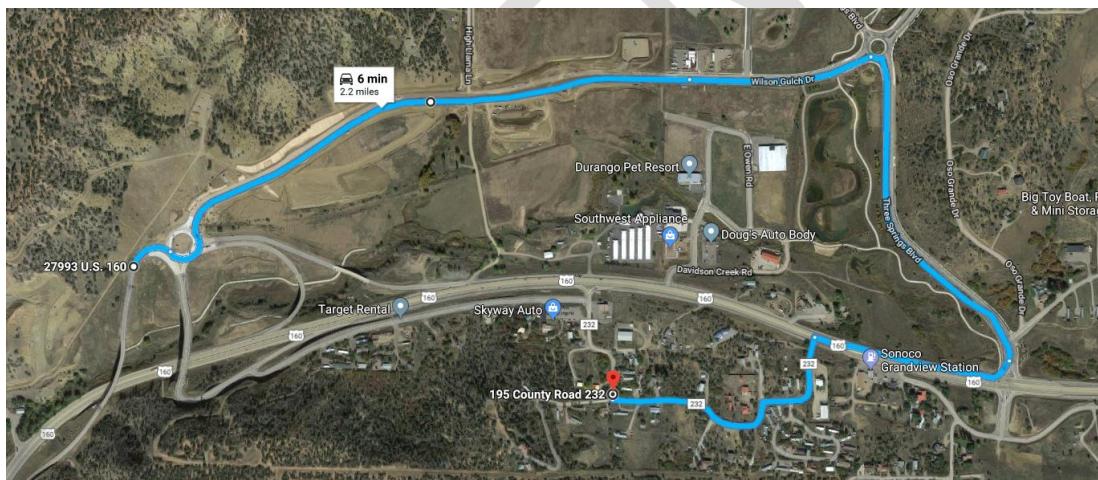

The detour map shows that the travel time increases by 2 minutes.

Fig 6.7: Original Route to CR-232

Fig 6.8: Detour to CR-232

The detour map shows that the travel time increases by 3 minutes.

The resulting detour would increase travel time for those impacted by 2-3 minutes. Additionally, an assessment of the impact of this detour on traffic operations at the Wilson Gulch Dr. / US-160 intersection and the US-160/Three Springs intersection was completed as shown in **Table 6.1 and Table 6.2**.

		SB	44.6	D	44.9	D	48.2	D	53.9	D

Analysis shows that for summer and winter counts, LOS is maintained at LOS D or better for all conditions, and that individual approaches are LOS E or better. The queueing reports do not show any significant change in queue lengths. For winter counts, closing Ramp B does not impact either intersection either. LOS is maintained at LOS D or better for all conditions. The queueing reports do not show any significant change in queue lengths. Therefore, this closure meets mobility thresholds for LOS requirements during both summer and winter conditions.

The closure of Ramp B would meet the mobility thresholds for travel time, delays and queueing. Therefore, it is recommended that the proposers be allowed to close Ramp B for the duration of the project.

6.3.2 US-160 / US-550 LANE CLOSURE

It is possible that lanes will need to be closed on US-160 at or near the current US-550 intersection to accommodate demolition of the existing intersection, reconstruction of the median or construction phasing for the new intersection. A closure of US-160 would impact **20,800 daily trips**. To evaluate this potential impact, an analysis was completed to evaluate how closing lanes may impact delay. The following intersection analyses were carried out at US-160/US-550:

- Closing one eastbound through lane
- Closing one westbound through lane
- Closing one eastbound and one westbound through lane

For the purpose of this analysis, it was assumed that these lane closures would be implemented prior to opening the new US-550/US-160 intersection. **Tables 6.2** through **6.7** shows the resulting delays at the intersection.

		EB	38.4	D	302.3	F	23.5	C	279.0	F
		NB	44.7	D	44.7	D	56.2	E	56.2	E

As shown in **Tables 6.2** through **6.7**:

- Closing an EB lane changes the intersection LOS from D to F for both summer and winter.
- Closing a WB lane has no impact on intersection LOS, most likely because the WB lane has free flow of traffic.
- Closing an EB and a WB lane has the same impact as closing only an EB lane.

Queueing

An evaluation of queueing was completed for this lane closure, and it was determined that:

- Closing an EB lane increases the queue length by a substantial extent.
- Closing a WB lane has no impact on queue length.
- Closing an EB and a WB lane has the same impact as closing only an EB lane.

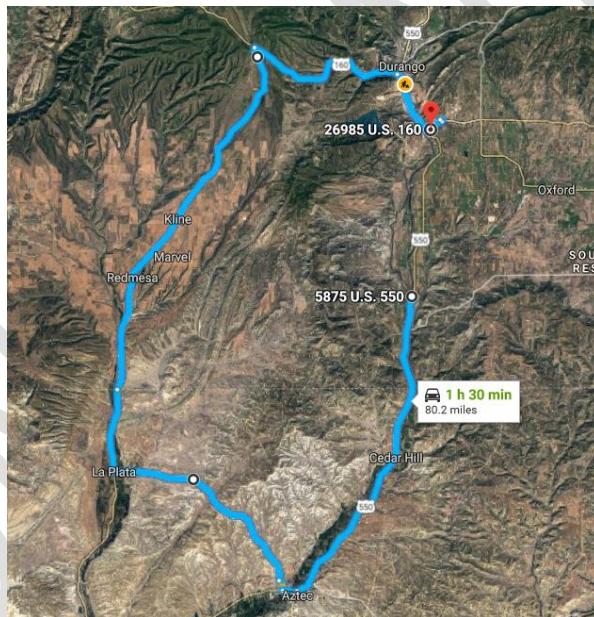

Details of the resulting queue lengths are provided in the **Appendix B**. Based on these results it is recommended that EB lane closures are not allowed during peak hours. While WB lane closures resulted in acceptable results, it is anticipated that long-term, peak-period closures WB would also likely result in frustration by the traveling public as US-160 is a critical facility. For this reason, it is also recommended that WB peak-period lane closures not be allowed on US-160. Lane closures should be restricted to short-term off-peak time periods only.

6.3.3 US-550 FULL CLOSURE

While it is not anticipated that long-term closures of US-550 would be needed, an evaluation of potential detours for US-550 was completed to evaluate the impacts thereof. If US-550 were to be closed, it would impact **8,900 daily trips**. The following potential detours scenarios exist:

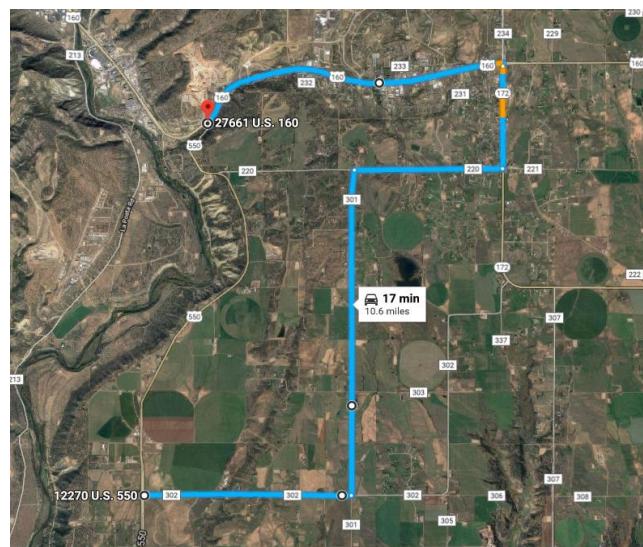

- 1) A regional detour southbound on US-550 to Aztec, NM; westbound on NM CR-574 to La Plata, NM; northbound on NM SR-170/CO SR-140 to Hesperus, CO, and eastbound on US-160 to Durango with reverse as shown on **Figure 6.9**.
- 2) A local detour eastbound on CR-302, northbound on CR-301, eastbound on CR-220, northbound on SR-172, and westbound on US-160 with reverse as shown on **Figure 6.10**.
- 3) A local detour eastbound/northbound on CR-302, northbound on SR-172, westbound on US-160 with reverse as shown on **Figure 6.11**.

Figure 6.9. US-550 Detour Scenario 1

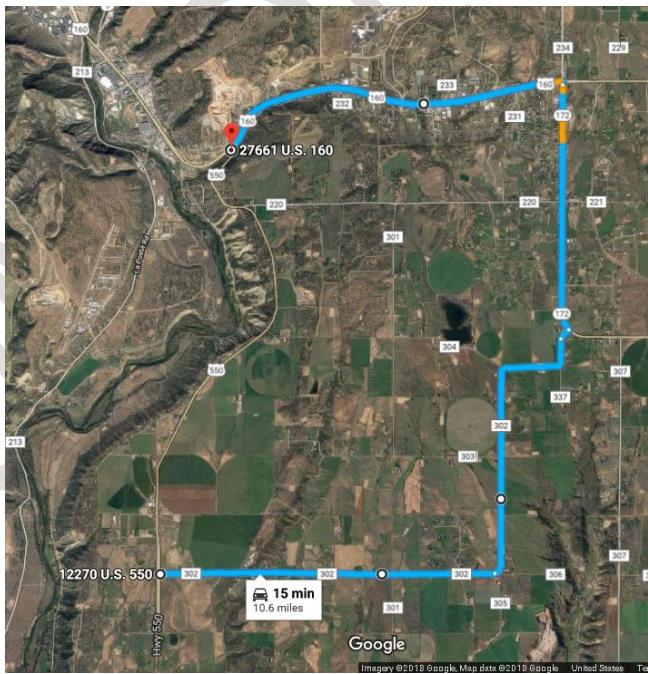

This route would represent approximately 80 miles (90 minutes of travel time) of out-of-direction travel and is an excessive delay to the traveling public. This route would also detour traffic into New Mexico, and would require coordination with NMDOT, San Juan County, and La Plata County. For these reasons, this route is not recommended.

Figure 6.10. US-550 Detour Scenario 2

This route would result in approximately 11 miles (17 minutes) of out-of-direction travel and would detour traffic from the state highway (US-550) to the county road system requiring coordination with the county.

Figure 6.11. US-550 Detour Scenario 3

This route would result in approximately 11 miles (15 minutes) of out-of-direction travel and would detour traffic from the state highway (US-550) to the county road system requiring coordination with La Plata County.

Based on the impacts and required coordination effort, Detour scenario 1 is not recommended. Detour scenarios 2 and 3 have similar impacts and would require coordination with La Plata County. Detour 3 would have the fastest out-of-direction travel time and would be within the mobility thresholds identified.

An evaluation of the impacts of detour routes 2 and 3 to LOS on adjacent intersections on US-160 was completed. The results are presented in **Table 6.8 and 6.9**.

			NB	0.3	A	0.1	A	0.4	A	0.2	A
			SB	0.5	A	0.4	A	0.6	A	0.5	A

As shown in **Table 6.8 and 6.9**, the detour results in LOS F conditions at US-160 / Three Springs Blvd. and at US-160/ SH-172 intersections during the Summer and winter AM peak hour. Queueing was also evaluated, and it was identified that the US-550 Full Closure would exceed available storage (and dramatically worsen) queues for the following movements:

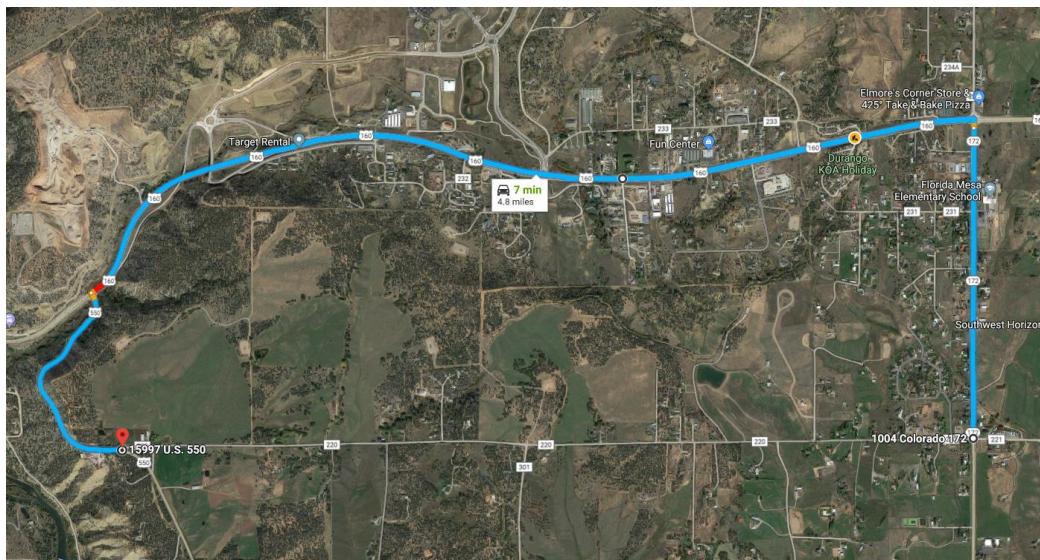

- Northbound left at US-160 / Three Springs Blvd
- Northbound through at US-160 / Three Springs Blvd
- Westbound through at US-160 / SH-172

This closure would result in impacts that exceed the allowed mobility thresholds and should not be permitted for summer or winter conditions.

6.3.4 CR-220 DETOURS

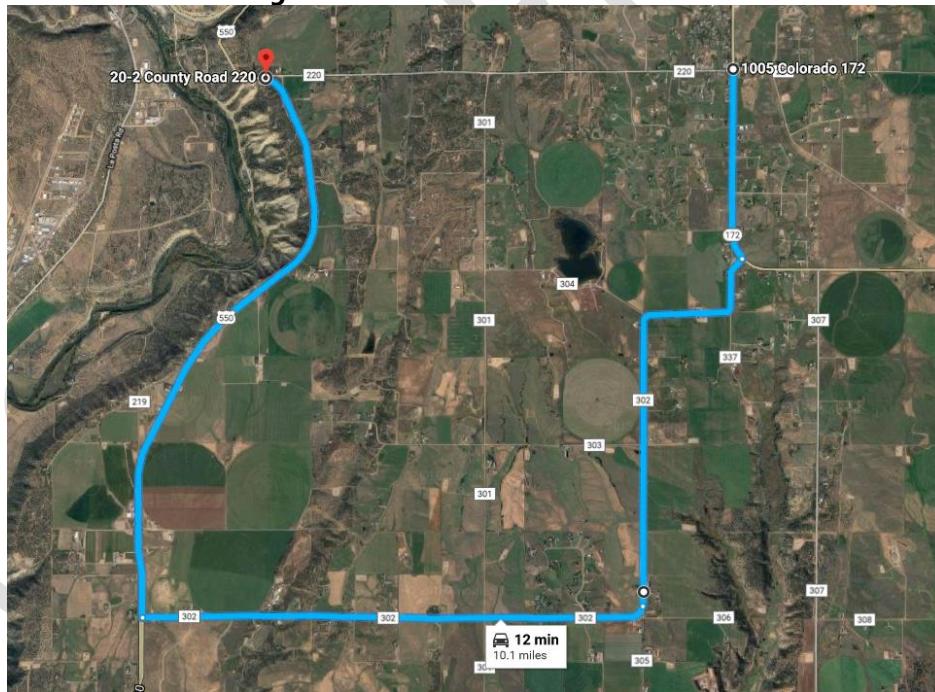

While it is not anticipated that long-term closures are needed on CR-220, allowing a long-term closure of this facility would potentially speed up construction activities. If CR-220 were to be closed it would impact **1300 daily trips**. **Figure 6.12** and **6.13** show potential routes for the detour.

Figure 6.12. CR-220 Detour Scenario 1

This route represents 4.8 miles (7 minutes of travel time) of out of direction travel.

Figure 6.13. CR-220 Detour Scenario 2

This route represents 10.1 miles (12 minutes of travel time) of out of direction travel. CR-220 Detour Scenarios 1 and 2 would be within the 20 minute threshold identified.

An evaluation of the impacts of detour routes 1 to LOS on adjacent intersections on US-160 was completed. The results are presented in **Table 6.10**.

			NB	0.3	A	0.3	A	0.4	A	0.4	A
			SB	0.5	A	0.5	A	0.6	A	0.6	A

As shown in **Table 6.10 and 6.11**, the intersection LOS is not maintained at LOS D or better overall at all intersections during summer peak. Also, during the winter peak, the NB approach at US-160 / SU-172 is LOS F for AM peak hour. No significant change in queueing was observed due to the detour. This closure does not meet mobility thresholds.

6.3.5 ONE-LANE / TWO-WAY OPERATIONS ON US-550

An analysis of one-lane / two-way operations on US-550 was completed to evaluate if this strategy would meet mobility thresholds. This strategy would restrict US-550 to a single lane and then implement reversible traffic flow on the lane. There are two approaches to implementing this kind of lane restriction that would vary in impacts to the traveling public:

1. A short distance operation that could be controlled by flaggers and/or temporary signal equipment
2. A longer distance operation that would be controlled using flaggers and a pilot vehicle.

The first operation would consist of a shorter "cycle" and a shorter "clearance interval" to clear out one direction of traffic to prepare for the other. For the second operation, it would consist of a longer "cycle" and a longer "clearance interval" to clear out traffic and get the pilot car turned around. As these two operations vary greatly, both were analyzed independently of each other.

Short Distance Operation

For the short distance operation, the following assumptions were used:

- Traffic would cycle every 5 minutes (both directions would be served every 5 minutes)
- There would be a 45 second clearance interval to allow for a transition between serving northbound and southbound traffic. This should allow enough time for traffic to travel approx. 2,000 feet at a reduced speed of 35 mph through the one-lane section with a 5 second buffer.

This condition was analyzed using Synchro (HCM 2000) for delay, and a Poisson calculation for queueing. The Poisson calculation was determined based on the following formula:

$$Q = 25 * (N + z\sqrt{N})$$

Where:

Q= Queue Length (ft)

N = Number of Vehicles per cycle

Z= 1.645 for a 95% confidence level

Given these assumptions, Table 6.12 shows the expected performance of this system.

Table 6.12 Short Distance Results

Location	Time Period	Delay (sec)	Longest Queue (ft)
US 550: Between US-160 and CR-220	Summer AM	80	1680
	Summer PM	88	1510
	Winter AM	74	1450
	Winter PM	81	1310
US 550: South of CR-220	Summer AM	73	1410
	Summer PM	81	1310
	Winter AM	70	1260
	Winter PM	77	1130

As shown in Table 6.12, both locations experience delays within the 20 minute threshold allowed. Queueing extends between 1130' and 1680' depending on the location/time of year. The queueing metric of fitting

within storage lengths would not be applicable in this situation, nor would LOS criteria. Based on these results, it is recommended to allow short distance one-lane/two-way operations during peak periods as the defined mobility threshold (travel time) is met and the other two mobility thresholds do not apply.

Given that the short distance results meet thresholds for all scenarios, it was determined that the long distance alternative should be evaluated for the "best case" condition to determine if it is feasible under the lowest traffic volumes, are the traffic volumes between south of CR-220 for the Winter AM condition. For the long distance evaluation, the following assumptions were used:

- The lane restriction would be in effect for the entire length of the project (20,000 ft)
- Traffic would travel at 35 mph behind a pilot vehicle, resulting in a one-way trip that would take 6.5 minutes to complete
- It would take 7 minutes for the pilot car to turn around and return
- The resulting "cycle length" is 20 minutes, with 10 minutes of "green time" allowed for each direction, and an "all red" time of 400 seconds for each direction to allow the area to clear.

Due to limitations of the methodology in estimating delay for such oversaturated conditions, SimTraffic was used to evaluate this scenario. Delay was estimated to be 19 minutes for the worst approach (NBT) which is very close to exceeding the 20 minute threshold, and should be considered to exceed the threshold. It certainly will for other scenarios with higher volumes. Additionally, this scenario would result in a queue of 5,350 feet, or just over a mile. While the definition of the queueing mobility threshold (fits within existing storage) is not applicable in this situation, this length of queue would be considered excessive and should not be allowed. Since this closure exceeded mobility thresholds for the "best" case no additional analysis of the other time periods or locations was completed. It is recommended that long distance lane closures be disallowed by the contract

7.0 OPTIONAL APPROACHES

The analyses outlined in this report are intended to give CDOT a basis of understanding of mobility opportunities and constraints associated with this major construction project. The analysis has been based on a proposed construction phasing approach in order to demonstrate that the project could be built within the identified mobility thresholds.

CDOT has a couple of fundamental choices on how to apply this information moving forward. The first option is to turn these recommendations into formal, prescriptive provisions that the contracting team must abide by. This path could make the project easier for all involved since there is less latitude for "stepping outside the box". The contractor and owner can focus on other resource-saving options instead of maintenance of traffic.

The other choice is for CDOT to use the information from this report as a foundation, or starting point, for MOT and staging. The contractor could be given the latitude to develop his own construction approach that also fits within the identified mobility thresholds. The burden of proof to demonstrate that the bidders approach meets mobility thresholds would be placed on the proposing team. This option provides an opportunity for greater creativity on behalf of the contracting team and ideally, could provide the most benefit to the traveling public.

Based on conversations with the team, it has been determined that the contractual requirements for MOT on this project will generally follow the first approach. That is to say that lane closures will be formally allowed or restricted by the contract. If the contractors wish to deviate from the formal requirements, they will be required to submit an ATC to do so. The requirements could be provided using the information in

Table 1.1.

8.0 MONITORING DURING CONSTRUCTION

It is recommended that CDOT include requirements for the contractor to monitor traffic congestion during construction and adjust lane closure strategies as needed to deal with unexpected circumstances. Monitoring can be accomplished by the contractor through use of a combination of any of the following concepts:

- A regularly scheduled meeting with all parties involved to discuss challenges and successes. This meeting should include representatives from CDOT including traffic and maintenance, the contractor, law enforcement, public outreach, incident management team, school district, impacted tribes, City representatives, and others as deemed necessary by CDOT.
- Providing a bi-weekly or monthly mobility report to the team outlining which construction occurred over the past month, report on mobility metrics, and provide an overview of upcoming construction activities that are planned or on-going.
- Floating-Car Travel Time measurements and queue surveys to evaluate compliance with the mobility thresholds.
- Use of newer technologies, such as gathering Bluetooth or cellphone data to evaluate compliance with mobility thresholds.
- Evaluation of any significant crashes or accidents or reoccurring accidents that occur within the area impacted by construction.
- Regularly held public surveys evaluating the perception of the public on construction delays
- Monitoring by CDOT supervisors and inspectors to report any unexpected traffic congestion to contractor and work through modifications to traffic control devices to mitigate congestion.

Monitoring compliance with the mobility thresholds is effective for increases to travel time as well as queueing, but is more difficult for LOS as this metric is difficult to measure in the field.

For many of these elements, such as travel time or public surveys, it is important that a "baseline" condition be established before construction activities begin to establish a control point to compare against. At a bare minimum, the contractor should be required to:

- Monitor compliance with the mobility thresholds for travel time and queueing.
- Regularly report measured compliance with mobility thresholds to CDOT.
- Coordinate with all effected parties (as outlined above).
- Establish a Transportation Management Plan (TMP) that outlines:
 - A summary of expected lane closures that complies with the requirements of the contract.
 - A plan for contingency and emergencies.
 - A Decision Tree including contact information for key personnel at CDOT and for the contractor.

9.0 RECOMMENDATIONS

The analysis results are compiled in **Table 8.1**, along with a recommendation of which closures evaluated should be allowed.

Table 8.1: Analysis Summary and Recommendation

Analyzed Closure	Summer Volume Impacted (Veh / Day)	Meets Threshold in Summer?			Meets Threshold in Winter?			Recommended	
		LOS	Travel Time	Queue	LOS	Travel Time	Queue	Summer	Winter
Long-Term Full Closure of Ramp B	600	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Long-Term WB Lane Closure on US-160	10,400	Yes	N/A	Yes	Yes	N/A	Yes	No ¹	No ¹
Long-Term EB Lane Closure on US-160	10,400	No	N/A	No	No	N/A	No	No	No
Long-Term Full Closure on US-550	8,900	No	Yes	No	No	Yes	No	No	No
Long-Term Full Closure on CR-220	1,300	No	Yes	Yes	No	Yes	Yes	No	No
Short Distance One-Lane Two-Way Operations on US-550	8,900	N/A	Yes	Yes	N/A	Yes	Yes	Yes	Yes
Long Distance One-Lane Two-Way Operations on US-550	8,900	N/A	No	No	N/A	No	No	No	No

1. Although this closure meets mobility thresholds, it is not recommended based on the impact that would be created for such a large volume of traffic.
2. This closure could be allowed if the distance of the restriction is limited to 500' or less.

As described in Section 5.3, short-term closures should be limited to between 7 PM and 7 AM.

Appendix A: Traffic Counts

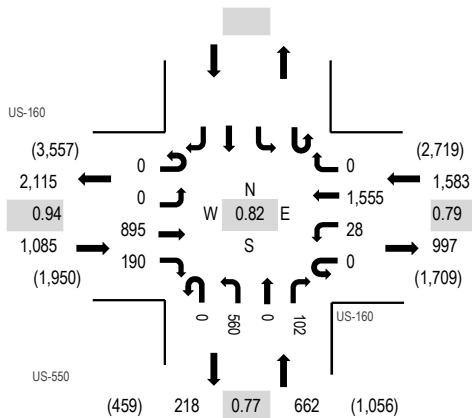

Location: 1 US-550 & US-160 AM

Date: Thursday, September 27, 2018

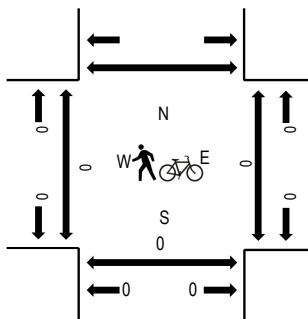

Peak Hour: 07:30 AM - 08:30 AM

Peak 15-Minutes: 07:45 AM - 08:00 AM

Peak Hour - All Vehicles

Peak Hour - Pedestrians/Bicycles on Crosswalk

Note: Total study counts contained in parentheses.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.
