Pavement Recommendation

This report is to provide documentation to the Region 5, Durango Residencies for a roadway improvement project. The project completes the connection of US 550 to US 160 at the Grandview Interchange (US 550 MP 12.50– 16.86). The current two-lane configuration of US 550 will be upgraded to a four-lane facility with intermittent auxiliary lanes and sections of frontage road for residential and commercial access. A roundabout will be constructed at the Grandview Interchange to facilitate traffic movements between US 550 and US 160. County Roads 219 and 220 will be reconstructed and realigned to meet this new configuration.

The pavement recommendations were developed following the Colorado Department of Transportation 2019 ME Pavement Design Manual (PDM) and using the AASHTOWare Pavement Mechanistic Empirical Design (M-E Design) software, Version 2.3.1.

Two pavement types; Hot Mix Asphalt (HMA), and Portland Cement Concrete Pavement (PCCP), were considered for US 550 mainline. In addition to the two pavement types, three pavement designs for each type (6 total), were developed based on the discrete subgrade they are to be constructed.

Pavement for CR 219, CR 220, Frontage Roads, and Ramp B shall be HMA. Pavement for the Roundabout shall be PCCP.

Table 1. HMA Recommended Pavement Structure Summary

Segments	Thickness of HMA Surface Course (in.)	Thickness of ABC Class 6 Base (in.)	Thickness of ABC Class 3 Subbase (in.)
US 550 Subgrade Surficial Soils	6	4	24
US 550 Subgrade Alluvial Gravel	6	4	0
US 550 Subgrade Bedrock	6	4	24
CR 219, CR 220, Frontage Rd.	5	4	24
Ramp B	6	6	8

ABC = Aggregate Base Course

Table 2. PCCP Recommended Pavement Structure Summary

Segments	Thickness of PCCP Surface Course (in.)	Thickness of ABC Class 6 (in.)	Thickness of ABC Class 3 Subbase (in.)
US 550 Subgrade Surficial Soils	8.5	4	24
US 550 Subgrade Alluvial Gravel	8.5	4	0
US 550 Subgrade Bedrock	8.5	4	24
Roundabout	9.5	4	24

ABC = Aggregate Base Course

Pavement Design Analysis

Pavement performance is dependent upon several factors, including; traffic loading and climate. Table 3 summarizes the HMA and PCCP pavement design parameters, specific design parameters can be found in Appendix A.

Table 3. Pavement Design Parameters

Parameters	Input		
	US 550 Mainline	CR 219, CR 220, Frontage Rd. and Ramp B	Roundabout
Reliability	90%	90%	90%
Two Way annual average daily truck traffic (AADTT)	589	200/300	1,500
Number of Lanes in Design Direction	2	1	1
Percent of Trucks in Design Direction	50	60	60
Percent of Trucks in Design Lane	90	100	100
Operational speed (mph)	45 mph	25 mph	20 mph
Vehicle Class Distribution (CDOT)	Cluster 3	Cluster 3	Cluster 3
Growth rate %	1.25	1.0/1.25	1.25
Growth function	Compound	Compound	Compound
Climate station	Durango, CO	Durango, CO	Durango, CO
Depth of Water Table	10	10	10
Design life (Rigid)	30-year minimum	NA	30-year minimum
Design life (Flexible)	20-year minimum	20-year minimum	NA
Performance criteria thresholds	<i>See Table 6 and Table 7</i>		

A discussion of design parameters and recommended threshold values of performance is provided below.

Traffic Loading

CDOT Online Transportation Information System (OTIS) was used to determine current and future traffic for this project (<http://dtdapps.coloradodot.info/otis>).

Average Annual Daily Truck Traffic (AADTT) is a design input for M-E Design and is calculated as the sum of projected single unit and projected combination trucks. From OTIS, the AADTT for the design year (2020) is 589 for mainline US 550. The AADTT for the roundabout is 1,500 and was calculated by combining US 550 and US 160 traffic.

Station ID	Route	Start	End	AADT	Year	Single Trucks	Combined Trucks	% Trucks	DHV	Projected AADT	Projected Single Trucks	Projected Combined Trucks
105554	550A	12.192	15.682	7,300	2016	230	330	7.7	12	7,680	242	347
105555	550A	15.682	16.561	6,700	2016	190	230	6.3	12	6,834	194	235

Figure 1. US 550 Design Year 2020 AADTT

Station ID	Route	Start	End	AADT	Year	Single Trucks	Combined Trucks	% Trucks	DHV	Projected AADT	Projected Single Trucks	Projected Combined Trucks
104812	160A	86.486	88.316	38,000	2016	490	380	2.3	10	40,584	523	406
104813	160A	88.316	91.478	26,000	2016	470	340	3.1	11	28,184	509	369

Figure 2. US 160 Design Year 2020 AADTT

A compound growth rate is used to account for traffic increase with time. The growth rate equation can be found in the 2019 PDM, Equation 3-1:

$$T_f = (1 + r)^n$$

Where,

T_f = OTIS 20-Year Growth Factor

r = Growth Rate

n = Number of Years

From OTIS, the 20-Year Growth Factor for this project is 1.26 resulting in a Growth Rate of 1.16. For purposes of conservative design, this value was rounded to 1.25.

Route	Start	End	Length	AADT	Year	20 Year Factor	Single Trucks	Combined Trucks	Projected AADT	Projected Single Trucks	Projected Combined Trucks	18 Kip ESALs
550A	12.192	15.682	3.447	7,300	2016	1.26	230	330	9,578	302	433	1,693,708
550A	15.682	16.561	0.878	6,700	2016	1.1	190	230	7,504	213	258	1,111,287

Figure 3. 20-Year Growth Factor

From OTIS, the 20-year 18k ESALs are 1,693,708 in the design lane, resulting in a 75 gyration mix (PDM table 6.9).

Figure 4. 20-Year 18k ESALs

Climate

Durango, CO weather station was selected within the M-E Design program. M-E Design uses weather station data to predict the pavements response to climatic factors such as temperature, precipitation and freeze/thaw cycles.

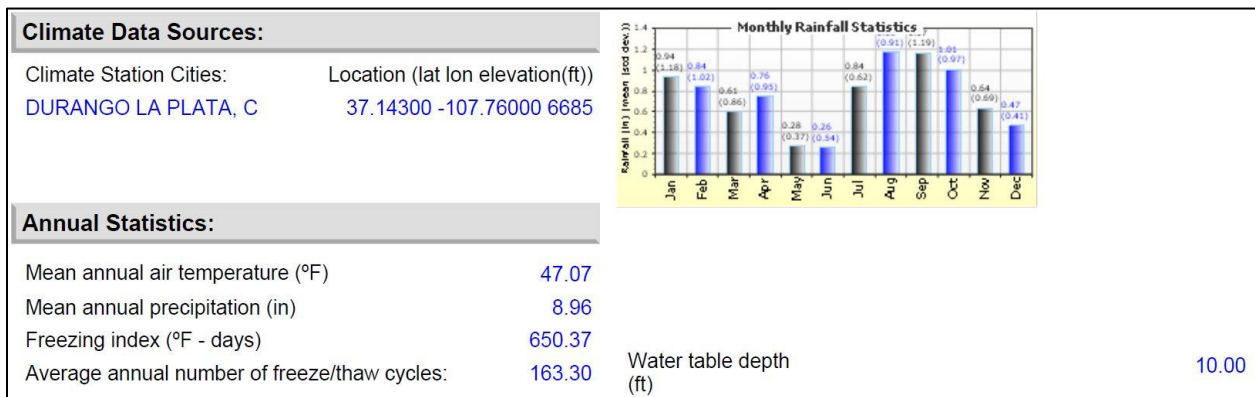

Figure 5. M-E Design Weather Station Selection

Roadbed Characterization

Yeh and Associates performed a geotechnical investigation to identify surface and subsurface conditions along the proposed alignment. The findings from this investigation can be found in the *Draft Geotechnical Data Report (GDR)* prepared by Yeh and Associates, Inc., dated July 17, 2018.

From the GDR, subsurface conditions along the proposed alignment can be classified into three distinct layers; surficial soil (low plasticity and high plasticity clay); terrace alluvium (gravelly soil); and bedrock (claystone with interbedded shale, sandstone and conglomerate). Because the proposed alignment will be constructed on these distinct subgrades, three discrete pavement designs (for each pavement material), were developed to optimize use of in-situ conditions. For purposes of pavement design, the subgrade was characterized as follows:

Table 4. Subgrade Classification

Layer	AASHTO Classification	R-value	Resilient Modulus (psi)	Plasticity Index	Approximate Location
Surficial Clay	A-7-6	10	6,482	27	South End
Terrace Alluvium	A-1-b	79	15,000 (max)	NP	Middle Portion
Claystone	A-6	23	8,152	12	North End

Pavement sections are layered systems and cannot be modeled as a homogeneous mass, therefore, the design resilient modulus (M_r) of the aggregate base and subbase layers must be adjusted for limiting modulus criteria. This phenomenon is described by the elastic layer theory and is necessary to avoid decompaction and build-up of tensile stresses in the unbound layers. Following the elastic layer theory, the M_r of subbase was determined to be 15,000 psi and the M_r of the base layer was 25,000 psi (PDM figure 5.2 and 5.3).

Following Chapter 4 of the PDM, the design resilient modulus was determined using the R-value correlation equation (Eq. 4-1, PDM):

$$M_r = 3438.6 \times R^{0.2753}$$

Where,

M_r = Resilient Modulus (psi)

R = R-value (AASHTO T 190)

Section 4.9 of the CDOT 2019 M-E Pavement Design Manual, Expansive Subgrade Soils, recommends Depth of Treatment Below Normal Subgrade based on Plasticity Index (PI). Surficial soils and bedrock within the project limits were sampled and analyzed for their physical properties. As reported in the GDR, the PI of the surficial soil and bedrock layers for areas of proposed “cut” was found to range from 8 to 27.

In order to maintain a consistent pavement section throughout the project length, the baseline pavement design requires 3 feet of subgrade treatment. This 3-foot treatment consists of 1-foot of subgrade, excavated; moisture-conditioned; and recompacted in accordance with Section 203 of the 2017 CDOT Standard Specifications, overlain by 2 feet of subbase. To achieve the project goal of maximizing the use of available on-site materials, the subbase course shall consist of granular material derived from the terrace alluvium deposit: Aggregate Base Course (ABC) Class 3 or material with a minimum R-Value of 70.

A filter separator layer is required on top of the reworked subgrade, directly beneath the subbase layer. Edge drains may be required to collect and divert water from the pavement structure.

Table 5. Treatment of Expansive Soils

Plasticity Index	Depth of Treatment Below Normal Subgrade Elevation
10 - 20	2 feet
20 - 30	3 feet
30 - 40	4 feet
40 - 50	5 feet
More than 50	Placed in the bottom of fills of less than 50 feet, or greater than 6 feet in height, or wasted

Table adapted from Table 4.9 of the CDOT 2019 M-E Pavement Design Manual

Recommended Threshold Values of Performance Criteria

M-E Design uses limiting threshold values of pavement distress and smoothness to evaluate the adequacy of a design. Table 5 provides the limit and predicted threshold values for new construction of Flexible Pavements and Table 6 shows criteria for new construction of Rigid Pavement (PDM table 2.4 and 2.6).

Table 6. HMA Threshold Values of Performance Criteria

Performance Criteria	Limit	Surficial Clay Predicted	Terrace Alluvium Predicted	Claystone Predicted	Frontage and CR Predicted	Ramp B Predicted
Terminal IRI (inches per mile)	200	166.01	163.06	165.78	168.39	164.82

Asphalt Binder Recommendations

Using the Long Term Pavement Performance (LTPP) binder selection program (LTPPBind 3.1), the 98% reliability binder for this project area is PG 58-28. From LTPPBind; Figure 6 shows the weather stations in the project vicinity, Figure 7 shows the selected station, Figure 8 shows the PG binder selection.

Appendix C – Pavement Designs

Pavement M-E Design Report – HMA on Clay

22420 US 550_HMA on Clay_FINAL_24

File Name: C:\Users\kempb\Documents\Projects\22420_550 160 Connection\Pavement Design\FINAL\22420 US 550_HMA on Clay_FINAL_24.dgpx

Design Inputs

Design Life: 20 years Base construction: May, 2020 Climate Data 37.143, -107.76
 Design Type: FLEXIBLE Pavement construction: May, 2020 Sources (Lat/Lon)
 Traffic opening: May, 2020

Design Structure

Layer type	Material Type	Thickness (in)
Flexible	R3 Level 1 SX(75) PG 58-28 United	6.0
NonStabilized	ABC Class 6	4.0
Subgrade	A-1-b	24.0
Subgrade	A-7-6	Semi-infinite

Traffic

Volumetric at Construction:	
Effective binder content (%)	10.7
Air voids (%)	5.5

Age (year)	Heavy Trucks (cumulative)
2020 (initial)	589
2030 (10 years)	1,024,410
2040 (20 years)	2,184,310

Design Outputs

Distress Prediction Summary

Distress Type	Distress @ Specified Reliability		Reliability (%)		Criterion Satisfied?
	Target	Predicted	Target	Achieved	
Terminal IRI (in/mile)	200.00	166.01	90.00	98.88	Pass
Permanent deformation - total pavement (in)	0.65	0.53	90.00	99.34	Pass
AC bottom-up fatigue cracking (% lane area)	25.00	20.67	90.00	94.84	Pass
AC thermal cracking (ft/mile)	1500.00	656.15	90.00	100.00	Pass
AC top-down fatigue cracking (ft/mile)	2500.00	1070.44	90.00	99.87	Pass
Permanent deformation - AC only (in)	0.50	0.38	90.00	99.22	Pass
