## Converting Project Data from other Softwares

**Did you know** that when converting project data from MOSS, Eagle Point, or some other software package that you can use LandXML to transfer the engineering data to InRoads. LandXML is a platform independent file format that is specifically designed to transfer engineering data between similar software platforms and it saves a lot of typing too! Most engineering software used by CDOT supports the LandXML file format.

JR Heathcote tried using LandXML to transfer a MOSS triangulation model to an InRoads surface and it worked like a charm, total time spent in this endeavor was about 5 minutes, most of which was spent exporting the data from MOSS. *Submitted By JR Heathcote Region 3*
