Dismissing AccuDraw

Did you know that if you point to your *AccuDraw* dialog box with your cursor and type the letter Q, you will close or Quit *AccuDraw*? You can then bring *AccuDraw* back by selecting its icon on your Primary Tools dialog box or *key-in accudraw activate*. This will actually toggle *Accudraw* on or off in the middle of a command. This Key-In would be handy to have on your Function Keys.

If a command is acting different than expected, often times dismissing *AccuDraw* and reopening it, will help the command to act as desired.
