

# CDOT MicroStation Menus

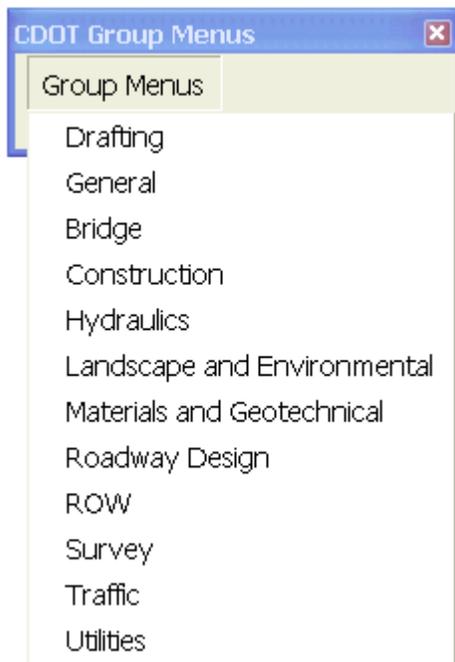

The CDOT Group Menu contains links to various drafting tools, both custom developed and MicroStation related. When the group menu is activated, the menu checks to make sure the user is in a group related file with the correct level library attached. If the user try's to run a command from the CDOT Menu (V02.04) VB menu, a warning message will inform the user they must exit MicroStation and run the group picker utility or attach the appropriate group dgnlib. By default the system sets the xxMulti-Discipline group. This group loads all the necessary associated files, thereby preventing the warning from appearing. This is the recommended specialty group to attach, unless it is desired to specifically work in only one group.

The CDOT Menu (V02.04) menu bar contains a Group Display pull-down, an Add On's pull-down and a Help pull-down. By selecting the Group Display pull-down, any desired discipline can be activated. Once activated, the menu will remember what disciplines were selected, each time MicroStation is opened and closed.

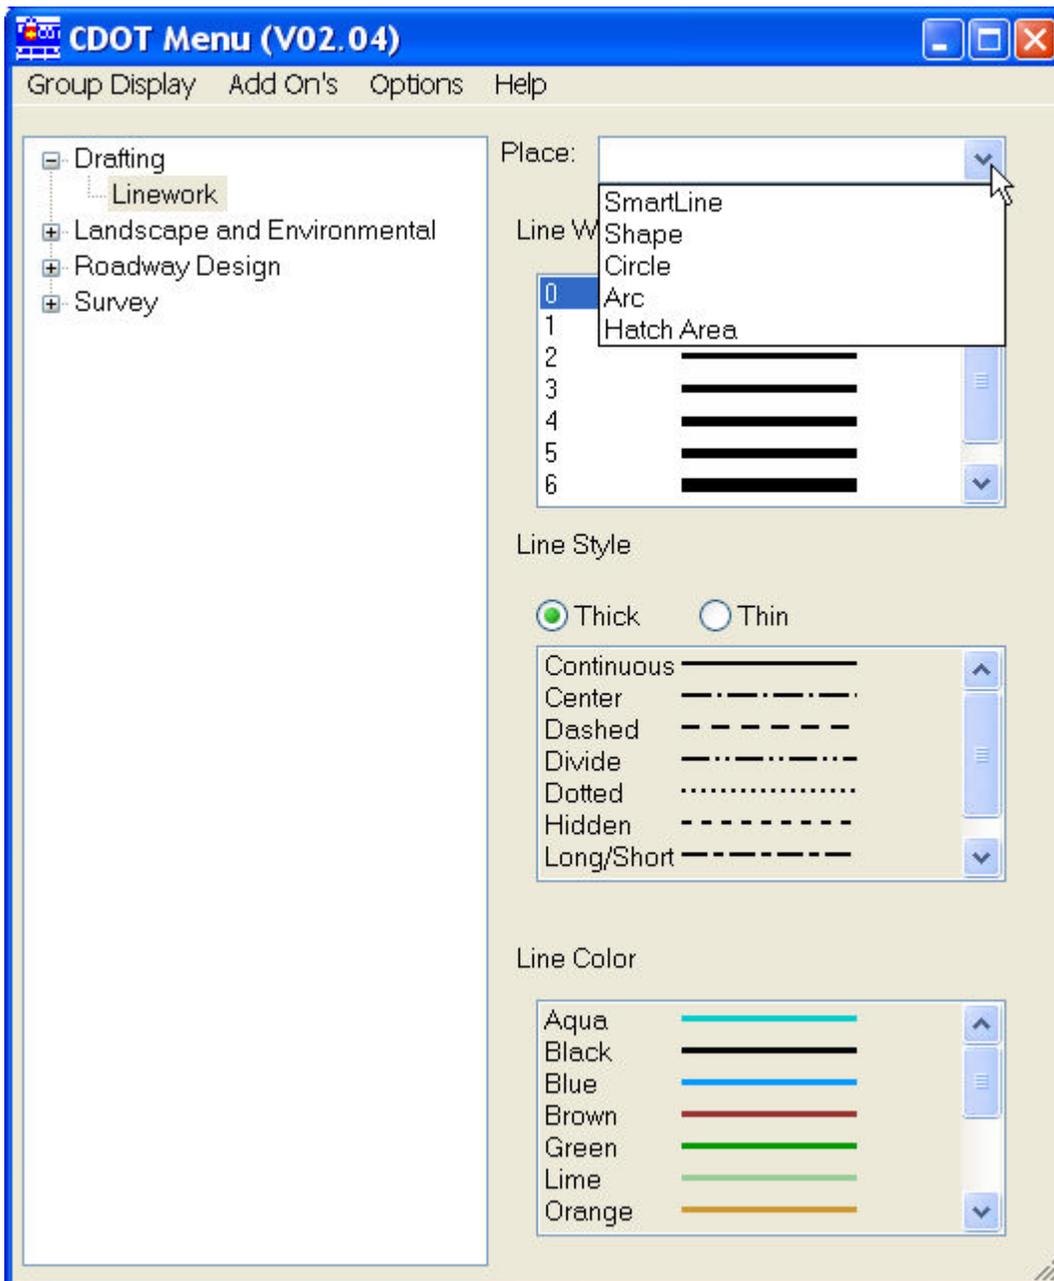

The Add On's pull-down contains custom utilities for assisting in MicroStation element creation.
