3. CDOT’S NEPA-SPECIFIC PLANNING AND PROJECT DEVELOPMENT ELEMENTS

The development of transportation projects is a multi-phased, multi-year process that involves significant commitment of technical and financial resources. This chapter discusses the National Environmental Policy Act (NEPA) elements of the Colorado Department of Transportation’s (CDOT) overall transportation planning and project development process.

3.1 Why CDOT Follows NEPA

CDOT has committed to following the intent and requirements of NEPA for all transportation projects, regardless of whether the projects have a federal nexus (Section 2.2.3). Although non-federal projects will not require federal agency approval, the NEPA process is an excellent framework for ensuring that environmental factors are considered consistent with CDOT’s environmental ethic. Thus, the guiding principles of NEPA have been incorporated into the CDOT transportation planning and project development process, as well as maintenance and operations of the state transportation system. Additionally, CDOT is committed to following NEPA, and this NEPA Manual is the main guidance document for NEPA compliance at CDOT as stated in CDOT Policy Directive 1904.0 National Environmental Policy Act Compliance (CDOT, 2012).

A key principle in NEPA is the use of an interdisciplinary approach. The application of this approach will lead to good transportation decisions and ensure responsible decision-making that includes social and environmental considerations. Several actions can be taken before the NEPA process officially begins to further promote CDOT’s environmental ethic and help streamline projects. These actions are discussed below.

3.1.1 Developing the Project Team

A project is initiated with the assignment of a project manager. Each CDOT Region’s Program Area Engineer assigns a project to a Resident Engineer, who, in turn, assigns a CDOT project manager. The CDOT project manager guides the project through the remainder of the process.

The CDOT project manager is required to involve the Region Planning and Environmental Manager (RPEM) in the development of Form 1048A Project Scoping/Clearance Record and Design Scoping Review (DSR) meeting, which is used in conjunction with the Project Development Manual (CDOT, 2013 as amended) and preparation of a Project Development Plan (PDP) to scope the project and track documentation or activity sign-off dates.
The RPEM will involve environmental specialists, who represent physical, biological, cultural, and socio-economic resources to:

- Identify environmental considerations during the early stages of project definition
- Identify environmental issues that could impact schedule or budget
- Guide the formal NEPA process, particularly if CDOT retains consultants for NEPA support

The environmental scoping form documents considerations for the lead team member (CDOT Region Environmental, CDOT Environmental Programs Branch [EPB], or Consultant), level of analysis and documentation (Brief, Some, Full, or Complete), and comments related to the specific environmental resource. The NEPA process is initiated immediately after the initial NEPA class of action designation (Section 2.4) and environmental study requirements are determined. The results of Form 1048A Sections 1 and 2 are discussed with the RPEM when an environmental study is needed. All information must be kept in the project file, which becomes part of the administrative record (further discussed in Section 6.15). Early coordination with the RPEM and environmental specialists will reduce the potential for time delays, increased costs, and project design changes. If the CDOT project manager and RPEM decide to contract a consultant to complete the study, they can use the CDOT Generic Scope of Work (CDOT, 2017b) to assign time and tasks to various team members. Section 6 of the Generic Scope of Work specifically refers to environmental tasks.

The core of the NEPA interdisciplinary project team consists of an assigned project manager from the region, a RPEM or their designee, a EPB NEPA specialist, the consultant (as needed), the Operations Engineer from FHWA’s Colorado Division assigned to the project, and local agency representatives (as appropriate). Other staff members, who may contribute to the project team over the course of the project, will include staff from CDOT Special Units, including Right-of-Way, Access, Engineering, Bridge, Maintenance, Safety, Traffic, Utilities, Materials, Soils and Geotechnical, and others, as necessary. Chapter 8 identifies staff and team members involved in the environmental document review process.

Outside the CDOT/FHWA project team, external agencies will also participate in the process. When different agencies have independent decision-making authority, the goal is to produce one NEPA document that will meet the regulatory requirements of all agencies. Executive Order 13807 Establishing Discipline and Accountability in the Environmental Review and Permitting Process for Infrastructure requires federal agencies to process environmental reviews and authorization decisions for “major infrastructure projects” as One Federal Decision—meaning designating a single lead federal agency and completing a single NEPA decision document. This Executive Order also sets a government-wide goal of reducing the average time for each agency to complete the required environmental reviews and authorization decisions for major infrastructure projects to two years.
3.1.2 Agency Project Roles

The US Department of Transportation (USDOT) agency conducting the NEPA analysis, such as FHWA or the Federal Transit Administration (FTA), serves as the lead federal agency for NEPA compliance on transportation projects. FHWA may act as a joint lead agency with either another federal agency (40 CFR § 1501.5 [b]) or a state or local agency under the Safe, Accountable, Flexible, Efficient Transportation Equity Act - A Legacy for Users (SAFETEA-LU) Amendments (SAFETEA-LU, 23 USC § 1001 - 11167). More detailed information about SAFETEA-LU can be found in Section 2.5.

The joint lead agency is typically the project sponsor, which is a state or local government, such as CDOT, receiving federal funds. When other transportation authorities or governmental entities serve in the role of a joint lead agency, FHWA will generally request CDOT to assist these governmental entities by acting as a program administrator for NEPA compliance. When CDOT performs NEPA, the standard used for document development and processing will be this CDOT NEPA Manual as stated in Policy Directive 1904.0 National Environmental Policy Act Compliance (CDOT, 2012a). The project sponsors are the local agencies applying to connect to a local roadway, a state highway, or an interstate or those that receive federal funds for a project.

A federal, state, Tribal, or local agency having special expertise with respect to an environmental issue or jurisdiction by law may be a cooperating agency in the NEPA process. A cooperating agency has the responsibility to assist the lead agency through participation in the NEPA process at the earliest possible time. The cooperating agency also participates in the scoping process and in developing information and preparing environmental analyses (including portions of an Environmental Impact Statement [EIS] where the cooperating agency has special expertise). Cooperating agencies also make support staff available at the lead agency's request to enhance the lead agency's interdisciplinary capabilities.

Participating agencies, as defined by SAFETEA-LU, are those with an interest in the project. The standard for participating agency status is more encompassing than the standard for cooperating agency status described above. Therefore, cooperating agencies are, by definition, participating agencies, but not all participating agencies are cooperating agencies. The lead agencies should consider the distinctions in deciding whether to invite an agency to serve as a cooperating/participating agency or only as a participating agency.

The roles and responsibilities of cooperating and participating agencies are similar, but cooperating agencies have more authority, responsibility, and involvement in the environmental review process. A distinguishing feature of a cooperating agency is that the Council on Environmental Quality (CEQ) regulations (CEQ, 40 Code of Federal Regulations [CFR] § 1500 - 1508) permit a cooperating agency to “assume on request of the lead agency responsibility for developing information and preparing environmental analyses including portions of the environmental impact statement concerning which the cooperating agency has special expertise.” An additional distinction is that,
pursuant to 40 CFR § 1506.3, “a cooperating agency may adopt without recirculation of the environmental impact statement of a lead agency when, after an independent review of the statement, the cooperating agency concludes that its comments and suggestions have been satisfied.” This provision is particularly important to permitting agencies, such as the US Army Corps of Engineers (USACE), who, as cooperating agencies, routinely adopt USDOT environmental documents.

Moving Ahead for Progress in the 21st Century Act (MAP-21) (Section 1205[b]) amended Section 139(c) of title 23 United States Code (USC) and allowed the Secretary of Transportation to designate a single Federal Lead Agency for purposes of environmental review if the project requires approval from more than one modal administration. MAP-21 (Section 1305[c]) amended 23 USC 139(d) by:

- Directing participating agencies to comply with the environmental review process requirements in Section 139, as amended by MAP-21;
- Requiring participating and cooperating agencies to carry out their obligations under applicable laws concurrently with the lead agency’s environmental review process, unless doing so would impair their ability to conduct needed analysis or otherwise carry out those obligations; and
- Requiring participating and cooperating agencies to formulate and implement administrative, policy, and procedural mechanisms to enable the agency to ensure completion of the environmental review process in a timely, coordinated, and environmentally responsible manner.

MAP-21 (Section 1305[a] [23 USC 139[b][3]]) included the provision for rulemaking to allow the use of programmatic approaches to conduct environmental reviews that:

- Eliminate repetitive discussions of the same issues;
- Focus on the actual issues ripe for analyses at each level of review; and
- Are consistent with NEPA and other applicable laws.

At a minimum, programmatic reviews should:

- Promote transparency, including the analyses and data used, the treatment of any deferred issues raised by agencies or the public, and the temporal and spatial scales to be used for analysis;
- Use accurate and timely information in the reviews;
- Describe the relationship between programmatic analysis and future tiered analysis;
- Describe the role of the public in the creation of future tiered analysis; and
- Be made available to other relevant federal and state agencies, Indian tribes, and the public.
Fixing America’s Surface Transportation Act (FAST Act) built on the authorities and requirements of SAFETEA-LU, MAP-21, and FHWA’s Every Days Counts efforts to accelerate the environmental review process for surface transportation projects by institutionalizing best practices and expediting complex infrastructure projects without undermining critical environmental laws or opportunities for public engagement. The FAST Act added a new procedural requirement aimed at ensuring early collaboration and efficient environmental reviews. That is, to the maximum extent practicable, the lead agency shall develop a single NEPA document sufficient to satisfy the requirements for any federal approval or other federal action required for the project, including permits issued by other federal agencies. Additional information about FAST Act can be found in Section 2.7.

3.1.3 Agency Coordination Plan

If conducting an EIS, Section 6002 of SAFETEA-LU requires that a project team complete an Agency Coordination Plan prior to the start of a project. The Agency Coordination Plan will define the roles and responsibilities of the various agencies, outline major project milestones, and define how input from stakeholders will be solicited. While this plan is required for EISs, it is encouraged for Environmental Assessments as well. In accordance with MAP-21, participating agencies must concur on the project schedule, if a project schedule is included in the Project Coordination Plan. FAST Act requires a schedule to be part of a Project Coordination Plan and requires the creation of a checklist to help project sponsors identify natural, cultural, and historic resources in the area of a proposed project. Appendix E includes an example template for an Agency Coordination Plan.

CEQ regulations include criteria for designating a lead agency if a conflict exists (CEQ, 40 CFR § 1501.5), as well as the roles and responsibilities of cooperating agencies (CEQ, 40 CFR § 1501.6). External agency involvement may also be dictated by existing intergovernmental agreements (IGAs) between CDOT and/or FHWA and the agency, such as:

- Memorandum of Understanding (MOU) among CDOT, FHWA, Bureau of Land Management (BLM), and the US Forest Service (USFS) Related to Activities Affecting the State Transportation System and Public Lands in the State of Colorado
- MOU among CDOT, FHWA Central Federal Lands Division, and USFS Region 2 for the Planning, Programming, Project Development, Construction and Maintenance of Forest Highways in the State of Colorado
- NEPA / Clean Water Act (CWA) Section 404 Merger Process for Transportation Projects in Colorado

A video explaining the MOU among CDOT, FHWA, BLM, and USFS is located here: https://www.codot.gov/programs/environmental/federal-lands-mou-video

Current IGAs can be found at: https://www.codot.gov/programs/environmental/resources/intergovernmental-agreements
MOU among FHWA, US Environmental Protection Agency (EPA), and CDOT that formalizes the cooperative working relationship among these agencies

Memorandum of Agreement (MOA) between CDOT and the Colorado Department of Public Health and Environment (CDPHE) Air Pollution Control Division (APCD) regarding procedures for determining project level conformity.

3.1.4 Project Lifecycle

In 1991, Colorado’s General Assembly enacted legislation directing that transportation planning is to occur as a cooperative process:

“...the General Assembly recognizes the Department of Transportation as the proper body, in cooperation with regional planning commissions and local government officials, for developing and maintaining the state transportation planning process and the state transportation plan.” §43-1-1101 Colorado Revised Statutes

With policy direction provided at the statewide level through the Colorado Transportation Commission, regional planning commissions prepare regional transportation plans (RTP) identifying and prioritizing their long-range transportation needs for all modes. These RTPs and priorities are integrated and consolidated into the long range multimodal statewide transportation plan (SWP), which serves as the blueprint for how transportation resources are invested and projects are selected for implementation.

Decisions made during planning can be reflected in project-specific NEPA documentation without revisiting those decisions depending on the process that was followed and the magnitude and sensitivity of the related issues. CDOT project managers must also work closely with their RPEM and planning staff to understand the required components of the project that have already gone through the planning process and may not need to be revisited. For more information on integrating planning with NEPA, see Section 3.2.

CDOT’s Project Development Manual (CDOT, 2013) identifies and describes the activities related to project development from conception to award of the build contract and establishes a uniform application of processes and procedures for use across CDOT. The Project Development Manual is organized into eight sections, each covering an important aspect of Form 1048A Project Scoping/Clearance Record. The following sections of Form 1048A are important to the initiation of NEPA:

- Section 1 states that the need for a preliminary field survey be assessed.
- Section 2 must be reviewed in coordination with the RPEM to determine the presence or absence of environmental considerations and the documentation of that information. This information will be used during the initiation of the NEPA process and will help the project team assess the need for supplemental field studies.

To find out more about the current Statewide and Regional Transportation Plans and other transportation planning related topics, see CDOT’s Statewide/Regional Planning website at: https://www.codot.gov/programs/planning

CDOT’s Project Development Manual can be found at: https://www.codot.gov/business/designsupport/bulletins_manuals/project-development-manual
Section 2 also addresses route location approval and environmental compliance. In compliance with the FHWA and the FTA jointly issued regulations, *Environmental Impact and Related Procedures* (FHWA and FTA, 23 CFR 771 § 771.101 - 771.131), all proposed projects must be assigned an environmental class of action designation, which helps determine the appropriate level of environmental studies and public involvement activities required for approval by CDOT staff. The RPEM is responsible for scoping the project and, in consultation with the project team and FHWA, determining the initial class of action and the environmental studies, approvals, and permits required.

### 3.2 Planning and Environmental Linkages (PEL)

PEL is a study process typically used to identify potential transportation benefits and impacts, along with environmental benefits and concerns, in an area, a corridor, or a specific location. It is generally conducted before overall project construction funding and phasing are identified, and before specific problems and solutions are known. Before a PEL study is conducted, a scoping process occurs to determine whether to even do a PEL study. It needs to be determined why the study is being conducted and what questions are trying to be addressed. Figure 3-1 presents a decision tree on whether to conduct a PEL study.

One condition that specifically needs to be considered when determining whether to do a PEL study is the shelf life of a PEL study. If NEPA does not begin within five years from the conclusion of the PEL study, the information from the NEPA study must validate the PEL alternatives analysis and confirm that conditions or policies and guidance that would affect the analysis and recommendations have not changed.

PEL studies can be used to make planning decisions and for planning analysis. These decisions and analyses, for example, can be used to identify and prioritize projects, develop the Purpose and Need for a project, determine project size or length, and/or develop and refine a range of transportation improvement alternatives. A PEL study can create a basic description of the area’s environmental setting, recommend methodologies for future environmental resource analysis, and identify mitigation strategies and programmatic level mitigation for potential impacts that are most effectively addressed at a regional or a state level.

The PEL process can be helpful in discovering needs and desires and garnering project support for an overall vision when a project involves multiple jurisdictions, and it can be used as a project prioritization tool. For example, a PEL study for a corridor could result in the identification of multiple potential projects (i.e., capacity improvements for a shorter length of the corridor, and intersection improvements), which can then be prioritized for implementation.
A PEL study evaluates and recommends operational strategies based on existing and reasonably anticipated technologies at the time of the study, either as stand-alone alternatives or supplemental options to identify project recommendations that will optimize safety and operational benefits. Due to the variance of applicability over future years, the technology concepts evaluated for a PEL study should consider potential time horizons and the CDOT-identified target Connected Roadway Classification (CRC) level for the study corridor(s). As new technologies arise, recommendations and prioritized projects may move forward in the future as modified with the proven applicability of new transportation technologies.

A PEL study may determine whether corridor managed lane strategies are appropriate when considering capacity improvement alternatives. The CDOT Managed Lanes Guidelines should be referenced for guidance on the planning process and documentation for managed lane strategies. The PEL study documentation should include a memorandum outlining the decision on managed lanes with the completed Managed Lanes Decision Form. When managed lanes have been evaluated in a previous PEL study, additional evaluation may not be required within the following NEPA study pending confirmation from FHWA and the CDOT RPEM.

PEL Study Use in NEPA

A PEL study links planning efforts to future environmental issues and results in valuable information that can be carried forward into the NEPA process. These studies must address some aspects of NEPA to be valid for incorporation into a future NEPA analysis; although the PEL study should cost less and take less time than a NEPA process. The environmental overview and resource information within a PEL study should be used to facilitate the scoping for subsequent NEPA documentation.

The PEL study should include a project vision or Purpose and Need with a list of specific project goals, a detailed area description that identifies environmental resource issues and constraints, and stakeholder involvement, including public and agency outreach. This should occur before any alternatives are developed. For the alternatives development and evaluation in a PEL study to be used by reference in a subsequent NEPA process, the basis of the evaluation, including the project Purpose and Need, evaluation criteria, and alternatives screening, must meet NEPA standards. Figure 3-2 presents a flowchart displaying the PEL process and showing the four FHWA coordination points required during the study.

At the conclusion of a PEL study, a letter will be requested from FHWA to acknowledge the completion of the study and that it was undertaken in a manner consistent with the FHWA PEL guidance. If the FTA is leading the PEL study, they should be consulted about their PEL acceptance process.

The adoption and use of a PEL study in the NEPA process is subject to a determination by FHWA, with the concurrence of other stakeholder agencies, that several specific conditions have been met. These conditions are listed in Section 1310, Integration of Planning and Environmental Review, part (d) of MAP-21.
*Note: Not all these steps must be followed. PEL studies can determine which steps apply based on the reason for the PEL

3.3 **Context Sensitive Solutions (CSS)**

Context Sensitive Solutions (CSS) represents an evolution in the philosophical approach to transportation development. It recognizes the need to develop transportation solutions that supplement and support the social, economic, and environmental context of the facility. CSS seeks a balance between four primary elements:

- Mobility
- Safety
- Preservation and Enhancement of the Natural Environment
- Community Values

Balancing these elements is accomplished using four key components:

- Project Purpose and Need
- Effective Involvement of a Full Range of Stakeholders
- Survey and Analysis of Environmental Features
- Use of Multidisciplinary Teams
Using these components and balancing the four elements, CSS seeks to proactively identify and address issues early in the project development process thereby reducing redundancy and lost time during project development, design, and construction. The early use of the four key components balances the four primary elements of CSS and leads to transportation solutions that are more effective and sustainable with fewer corrections and changes needed later.

While aesthetic treatments and visual enhancements are often features in designing a facility that is responsive to stakeholder needs, CSS should not be construed as simply a beautification requirement. CSS represents comprehensive solutions to transportation issues in such a way as to minimize negative impacts to all stakeholders and to design projects that best fit the physical setting, work with and enhance the community and environment of which they are a part.

A specific section on CSS should not appear in any NEPA document. It should be reflected in the way the NEPA process is implemented. Ideally, CSS will influence how project decisions are made and how the other sections are written.

Because each project has a unique context, a one-size-fits-all process for CSS is not appropriate. How CSS principles and tools can be effective for each project must be developed individually, through the level of stakeholder involvement appropriate for each project.

### 3.4 CDOT and the 1601 Process

The CDOT Policy Directive 1601.0 and Procedural Directive 1601.1 Interchange Approval Process describe a CDOT process to review requests for interchanges and major improvements to existing interchanges on the state and federal-aid highway system that could affect highway travel (CDOT, 2005). The Colorado Transportation Commission established CDOT Policy Directive 1601.0 and Procedural Directive 1601.1 to provide fair and consistent procedures regarding the review and evaluation of requests for new interchanges and major improvements to existing interchanges on the state highway system.

The 1601 process requires, among other things, that the interchange:

- Be consistent with an approved fiscally constrained RTP and SWP, and included in a Transportation Improvement Program (TIP) and/or Statewide Transportation Improvement Program (STIP)
- Be the subject of approved IGAs that address the funding of the application development and review process, timeline and analytical expectations, and an IGA covering construction, operations, maintenance, and replacement of the interchange
- Have sufficient environmental, operational, and other studies performed consistent with FHWA interchange approval and NEPA requirements

CDOT's 1601 process is required when there is a request for an interchange or major improvements to an existing interchange. Of these 1601s, some also may require FHWA’s Interchange Approval Request (IAR) process if they affect interstate travel. Although different processes, they can be completed at the same time.
The scope of study and level of detail and effort depend on the improvement type and the complexity of the interchange proposal. The 1601 interchange approval process identifies three types of interchange requests: Type 1, Type 2, and Type 2a.

Type 1 requests consist of two categories: (1) Proposals for new interchanges on the state highway system with a functional classification of interstate or freeway; and (2) Any type of proposal on the state highway system not initiated by CDOT that anticipates CDOT cost-sharing participation. Type 1 requests must be approved by the Transportation Commission.

Type 2 requests consist of proposals for a new interchange not on the interstate or freeway system and all modifications or reconfigurations to existing interchanges. Type 2 requests must be approved by the Chief Engineer, who may elevate the request to the Transportation Commission for consideration.

Type 2a requests consist of minor interchange improvements that will have little or no impact to the state highway system or surrounding local transportation system, consistent with the definitions and guidance provided in the FHWA Colorado Division Control of Access to the Interstate and its Right of Way (FHWA, 2005). Type 2a approvals are delegated by the Chief Engineer to the CDOT Region Transportation Director.

The steps in the 1601 interchange approval process include:

- Step 1: 1601 Pre-Application Meeting(s)
- Step 2: Initial IGA Approval
- Step 3: System Level Study Preparation
- Step 4: System Level Study Approval
- Step 5: Metropolitan Planning Organization (MPO)/Transportation Planning Region (TPR) Board Approval
- Step 6: Design and NEPA Approval Process
- Step 7: Final IGA

A System Level Study is required for both Type 1 and Type 2 proposals and should provide enough information to support the FHWA IAR or Minor Interstate Modification Request (MIMR). Type 2a proposals do not require a System Level Study but should have sufficient data to substantiate the determination of “no potential for significant impact” in accordance with the FHWA Colorado Division Control of Access to the Interstate and its Right of Way (FHWA, 2005).

The purpose of a System Level Study is to identify the short- and long-term environmental, community, safety, and operations impacts of a proposed interchange or interchange modification to the degree necessary for the CDOT Chief Engineer, Transportation Commission, and FHWA to make an informed decision on whether the proposed interchange or interchange modification is in the public interest.
A System Level Study includes:

- Draft Purpose and Need Statement
- Existing and Forecasted Conditions
- Alternatives
- Planning-level Evaluation of Alternatives
- Environmental Considerations
- Funding and Phasing

The IAR approval, a two-step process, was developed to help the state manage risk and provide flexibility. The process is intended to identify fatal flaws and to help ensure that the investment in environmental documentation is not wasted. The first step is a finding of operational and engineering acceptability. The second step is the final approval. The FHWA approval constitutes a federal action and requires that NEPA procedures are followed. Compliance with NEPA procedures need not precede the determination of engineering acceptability. However, final approval of access cannot precede the completion of NEPA. Once NEPA has been completed, approval of access is granted if no changes resulted to the accepted concept.

### 3.5 Funding and Fiscal Constraint in NEPA

The cost, size, and complexity of transportation projects, combined with limited available funding, often result in transportation projects being funded and implemented over a lengthy period rather than all at once. This section describes the funding and timing of project implementation in relation to the NEPA process. This discussion includes:

- Fiscal constraint requirements for initiating and completing NEPA
- Phasing and timing of construction in relation to NEPA
- Interim construction requirements
- Timing of mitigation

#### Funding Definitions

In describing the requirements of fiscal constraint with respect to NEPA, the following FHWA definitions (FHWA, 2011) apply:

- *Fiscal constraint* means that the metropolitan RTP, TIP, and STIP have sufficient financial information to demonstrate that a project in the RTP, TIP, and STIP can be implemented using committed, available, or reasonably available revenue resources.

- *Available funds* are funds derived from existing sources dedicated to or historically used for transportation purposes. For example, apportioned/authorized federal-aid dollars or toll revenues for the next 2 to 4 years. [23 CFR § 450.104]

State regulations (2 CCR 601-22) require fiscal constraint of the SWP (this is not a federal requirement; fiscal constraint is only required for MPO plans).
Committed funds are funds that have been dedicated or obligated for transportation purposes. For example, funds obligated for a federal-aid project or toll revenues for the next 2 years. [23 CFR § 450.104]

Reasonably available funds - Determining whether a future funding source is reasonably available requires a judgment decision. Two important considerations in determining whether an assumption is “reasonable” are (a) evidence of review and support of the new revenue assumption by state and local officials and (b) documentation of the rationale and procedural steps to be taken with milestone dates for securing the funds.

3.5.1 Fiscal Constraint Requirements

FHWA and CDOT have specific requirements, based on statutes and regulations, for the demonstration of fiscal constraint for a project prior to final NEPA approval (Categorical Exclusion [CatEx], Finding of No Significant Impact [FONSI], or Record of Decision [ROD]). Fiscal constraint for a project is demonstrated by satisfying the requirements of specific transportation planning and air quality conformity regulations, as described in this section.

The Metropolitan Planning Regulations (23 CFR 450.322) and the Clean Air Act (CAA) Transportation Conformity Rule (40 CFR 93.104) work together to require that a project located in an MPO (the geographic area in which the metropolitan planning process is carried out) and/or in a CAA nonattainment or maintenance area, be contained in a conforming, fiscally constrained long range RTP. The CAA requires air quality conformity to be demonstrated for major transportation projects in non-attainment and/or maintenance areas.

The following fiscally constrained transportation plans must identify all projects that are expected to receive federal funds or that will require FHWA or FTA approval:

- RTP - Identifies projects anticipated to be constructed over the next twenty years.
- TIP - Identifies capital and non-capital surface transportation projects, as well as regionally significant projects within the metropolitan planning area to be constructed in the next six years.
- STIP - Identifies capital and non-capital transportation projects (or phases of projects) proposed for funding under Titles 23 and 49 of the USC, as well as all regionally significant transportation projects regardless of funding source and/or requiring action by FHWA and FTA over a six-year period.

Conformity is required by Clean Air Act Section 176(c). This section requires that Federal agencies do not adopt, accept, approve or fund activities that are not consistent with State air quality goals.
Transportation Planning Process Context

In 1991, Colorado’s General Assembly enacted legislation providing the basis for the transportation planning process in Colorado. The law requires the development of a comprehensive fiscally constrained, long range 20-year SWP that incorporates the priorities and needs of Colorado’s 15 TPRs. CDOT carries out a continued, cooperative, and comprehensive statewide multimodal transportation planning process with its 15 TPRs. Of the 15 TPRs, 10 are considered non-urban TPRs, and the 5 located in urban areas are considered MPOs. Each TPR includes the municipalities and counties within its established boundaries.

The planning process includes the development of long range multimodal RTPs by each TPR, which are integrated into the SWP. The RTPs and SWP include fiscally-constrained and fiscally-unconstrained vision components and identify the needs, corridor visions and strategies, and/or projects anticipated to be constructed over the next 20 or more years. The SWP combines the individual corridor visions of the TPRs into a statewide vision that links transportation goals and strategies to investment decisions.

The SWP includes an environmental section that lists conservation and management plans for resource agencies in each TPR and MPO RTP. The SWP is supported by environmental technical reports, transit technical reports, etc. Each of the 15 TPRs includes corridor visions that integrate community values, land use decisions, and environmental concerns with transportation needs. The RTPs include an environmental overview that addresses expected environmental, social, and economic impacts of the recommendations contained in the transportation plan. Colorado Revised Statute 43-1-1103 states that the RTPs shall include expected environmental, social, and economic impacts of the recommendations contained in the transportation plan. The TPRs have updated corridor visions to identify current trends and conditions. Corridor visions increase the efficiency and accountability of the transportation system by aligning vision strategies and project priorities.

CDOT also develops a STIP that identifies the short-term project needs and priorities of the state of Colorado. In addition, under federal law, all MPOs are required to develop a short-term capital improvement program TIP consistent with the long range RTPs for each MPO. Similar to the STIP, the TIPs for each MPO are updated every four years and include a six-year planning horizon. TIPs approved by the MPOs and Governor are included in the STIP without modification. STIP projects must be consistent with the corridor visions identified in the SWP. The RTP and SWP and corresponding TIP identify all federally funded and regionally significant projects, if applicable.
Fiscal Constraint Requirements for NEPA

FHWA has provided guidance regarding the relationship of transportation planning to NEPA approval, with an emphasis on fiscal constraint, in two memoranda. As described in the memoranda, to demonstrate fiscal constraint, certain requirements of the transportation planning process must be completed before initiating and/or finishing the NEPA process. Constraint requirements must be indicated in the NEPA document in a project phasing and implementation section, or elsewhere as appropriate.

In addition to the fiscal constraint requirements, it is incumbent on FHWA and CDOT to consider the broader context of fiscal stewardship when making NEPA decisions, including the decisions on whether to initiate the NEPA process. Fiscal stewardship is a critical role and responsibility for FHWA and CDOT and is engrained throughout the transportation decision-making process: from fiscal constraint requirements in the transportation planning process, to reasonable cost estimates of alternatives in project development and the NEPA process, to financial plans and major project requirements during design and construction.

Table 3-1 details the federal planning and NEPA requirements that must be met whether the environmental process is funded with federal-aid.

| Metropolitan Areas (MPO) | ▪ Entire project is in the RTP  
▪ At least one subsequent phase of the project to be cleared in NEPA must be in the TIP (more if within TIP timeframe) or STIP  
▪ Full funding is reasonably available for the completion of the entire project  
▪ Project level conformity determination for all projects subject to transportation conformity |
| Non-Metropolitan Areas (Outside MPO) | ▪ Project is consistent with the SWP  
▪ At least one future phase of the project is in the STIP (more if within STIP timeframe)  
▪ Full funding is reasonably available for the completion of the entire project |

3.5.2 Phasing/Timing of Construction

Transportation projects are often implemented in phases. This may be done for several reasons, the most obvious of which is the ability to physically construct the project. Another reason is funding limitations that may preclude the ability to construct the entire project at one time. Phased implementation is typically detailed during final design. However, the requirements of fiscal constraint must be satisfied for NEPA approval, as described above.

In cases where a project is implemented in more than one phase, each phase should have independent utility and logical termini to the extent that the phase provides a functional transportation system even in the absence of other phases (i.e., the phase to be implemented has the ability to operate on its own). Each phase must also meet the project purpose and need. In addition, any mitigation measures needed in response to project impacts must be implemented with the phase in which the impacts occur, rather than deferred to a later phase.

When project construction is anticipated to occur in one, two, or more phases separated by a period of time (rather than normal construction phasing), this situation should be described in the NEPA document and in the accompanying public involvement process.

The discussion should include:

- Project funding status
- Project phasing
- Implementation schedule
Often funding limitations may make it difficult to predict the timing of future phases, and in these cases, measures must be taken to ensure the independent utility of each phase. Additionally, it must be demonstrated that air quality conformity will not be jeopardized.

In establishing project phasing, FHWA, CDOT, and local agencies may establish criteria to be used as guidelines in establishing logical project phases including:

- **Independent utility/logical termini** - Each phase should have independent utility and logical termini to the extent that the phase provides a functional transportation system even in the absence of other phases

- **Elements of purpose and need** - Each phase should contribute to meeting the purpose and need for the entire project

- **Environmental impacts** - Individual phases should avoid the introduction of additional environmental impacts that cannot be mitigated

- **Mitigation paired with impacts** - Each phase should include appropriate mitigation measures to match the environmental impacts of that phase

- **Fiscal constraint** - Any phase selected must meet the requirements of fiscal constraint

- **Air quality conformity** - Any phase selected must meet the requirements of air quality conformity

Using criteria such as these can establish a series of logical phases. In addition to these criteria, logical sequencing of phases in terms of constructability and operation should be considered and a general priority of needs applied, with system reliability and safety often as the top priority.

### 3.5.3 Interim Conditions

When a project is constructed in phases, interim conditions will exist between project construction phases. In some cases, such as when phasing is done only for constructability and/or to maintain traffic on an existing facility, the interim conditions may be short term, lasting only until the next construction phase can begin. In other situations, such as limited funding, interim conditions may last for years.

In some cases where funding is limited, it may be desirable to phase the project to provide interim improvements and benefits earlier rather than waiting for funding for full construction. However, the decision to phase a project in this way should weigh the benefits with additional costs (for example, extra cost for throwaway construction that must be replaced in a future phase) and any additional impacts of phased construction for example. In general, throwaway costs should be minimized.
When interim conditions are expected to last several years, this should be described in the NEPA document. The effect on the transportation facility and any other impacts (such as access or environmental impacts) should be discussed. From a traffic operations standpoint, it is important that the interim construction does not introduce safety problems. Additionally, any interim construction should provide transportation system benefits and should not cause any portions of the transportation system to operate unacceptably or worse than it would without the interim construction. When interim conditions are expected to remain for several years, traffic and/or safety analyses may be needed to establish that the interim improvements will operate at an acceptable level of service in the future.

3.6 Roadway Devolution

Devolution is defined as the transference of a highway or segment of highway from state ownership and control to local government ownership and control. The authorizing statutes include CRS 43-1-106, 43-1-110, 43-1-114, 42-2-101, 43-2-106, 43-2-110, 43-2-144, and 43-2-303. These statutes empower or authorize CDOT, its Chief Engineer, and the Executive Director to make determinations about abandonment of state highways to affected municipalities and counties. They also provide the authority of the locals to accept an abandoned highway and the need for the entity to establish a special fund to be used only for transportation-related expenditures.

Generally, roadway devolution will not include an interstate and will not have a federal nexus. Roadway improvement actions are not included with the devolution, and no future actions are evaluated. Under these circumstances, CDOT uses the CDOT Categorical Exclusion Form 128 to process roadway devolutions. Chapter 5, Categorical Exclusions, provides specific directions on using Form 128. CDOT’s Environmental Stewardship Guide (CDOT, 2017a) also provides further description of environmental requirements pertaining to roadway devolution.

Resource analysis to support a roadway devolution typically will not include field surveys or samplings to gather additional data. Data is derived from a windshield survey or what is readily available in databases or from previous studies (unless required by law). Environmental analysis will not identify environmental resources or sensitive receptors outside the right-of-way.
3.7 Alternative Project Delivery

This section discusses common innovative project delivery activities and how they integrate with the NEPA process.

3.7.1 NEPA Requirements and Permissible Project Activities

NEPA review and approval is required for transportation projects being advanced using any project delivery method. For all delivery methods, the NEPA process must be completed and a final NEPA decision must be reached before the project can proceed to final design and construction. FHWA Order 6640.1, as implemented by CDOT's design bulletin revised December 22, 2011 regarding permissible activities during the NEPA process, defines an expanded definition of Preliminary Design and is discussed below (CDOT, 2011).

For purposes of this section the definition of preliminary and final design are as follows (CDOT, 2011):

- **Preliminary design** - Includes, but is not limited to, preliminary engineering and other activities and analyses, such as environmental assessments, topographic surveys, metes and bounds surveys, geotechnical investigations, hydrologic analysis, hydraulic analysis, utility engineering, traffic studies, financial plans, revenue estimates, hazardous materials assessments, general estimates of the types and quantities of materials, and other work needed to establish parameters for the final design.

  Additional preliminary design activities include design and engineering activities to be undertaken for the purposes of defining project alternatives; completing the NEPA alternatives analysis and review process; complying with other related environmental laws and regulations; environmental justice analyses; supporting agency coordination, public involvement, and permit applications; development of environmental mitigation plans; development of typical sections, grading plans, geometric alignment, noise wall justifications, bridge type/size/location studies, temporary structure requirements, staged bridge construction requirements, structural design (sub and super structure), retaining wall design, noise wall design, design exceptions, guardrail length/layout, existing property lines, title and deed research, soil borings, cross sections with flow line elevations, ditch designs, intersection design/configuration, pavement design, storm/sanitary sewer design (plan/profile), culvert design, identification of removal items, quantity estimates, pavement details/elevation tables, and preliminary traffic control plans to be maintained during construction.

- **Final design** - Means any design activities following preliminary design and expressly includes the preparation of final construction plans and detailed specifications for the performance of construction work.
3.7.2 Approval to Proceed with Activities Beyond the Normal Scope of Preliminary Design

CDOT may request concurrence from FHWA to allow CDOT to go beyond the normal scope of preliminary design activities, as defined above. Subject to FHWA approval, activities may be permitted to advance as part of preliminary design when they meet one or more of the following:

1. The activities are necessary to identify impacts and mitigation in the NEPA process
2. The activities are beneficial to enhance the project schedule and do not affect the NEPA decision
3. The activities provide vital information for other projects or agencies and do not affect the NEPA decision
4. Other reasons as deemed appropriate

Prior to activities proceeding the CDOT RPEM and Program Engineer must write a letter to the FHWA Division Administrator and concurrence must be obtained.

3.7.3 Project Delivery Methods

CDOT currently uses three project delivery methods: design-bid-build, design-build, and construction manager/general contractor (CM/GC). These three project delivery methods are described in this section. Additional delivery methods may emerge as innovations continue.

Design-Bid-Build

Design-bid-build is the traditional project delivery method where design and construction are sequential steps in the project development process. With the design-bid-build method, CDOT may award a design contract to an engineering firm using a qualifications-based procurement process. When the preliminary and final design phase is complete, and project certification approval indicating all environmental commitments is included, the final design is prepared and signed by the RPEM or their designee; a construction contract will be awarded to a contractor with the lowest responsive bid through a competitive process. Under this type of delivery, the NEPA decision is made after preliminary design is complete, prior to starting final design, and before the construction contract is awarded.

Design-Build

Design-build is a project delivery method where both the final design and construction phases of the project are combined into one contract and awarded to a single entity. With this delivery method, preliminary design is typically completed in conjunction with the NEPA process, and before the design-build contractor is selected. Pursuant to 23 CFR § 636.109(b)(6), the design-build contractor cannot be involved in the NEPA process or documentation. Specifically, subpart 636.109(b)(6) states: “the design-
CDOT NEPA Manual

builder must not prepare the NEPA document or have any decision-making responsibility with respect to the NEPA process.” CDOT (or an independent consultant under CDOT’s direction) must prepare the NEPA document.

CDOT may award a design contract for preliminary design to an engineering firm using a qualifications-based procurement process, and that firm is then precluded from pursuing the design-build contract. With the design-build method, CDOT may award the design-build contract on a low-bid basis or best value basis through the evaluation of certain factors that are identified in a request for proposals. For design-build projects, the design-build contract may be awarded either after or prior to the NEPA decision. If the design-build contract is awarded before the NEPA decision, the design-build contract is divided into two notice-to-proceed phases. The notice to proceed Phase 1 scope is limited to preliminary design-related activities. The notice to proceed Phase 2 scope includes final design and construction. The contract should state that the range of alternatives will be considered, that the issuance of notice to proceed Phase 2 is conditional upon the selection of an alternative in the NEPA decision during notice to proceed Phase 1, and that all environmental commitments in NEPA and associated permits will be adhered to. This by-passes the project certification approval by the RPEM and adds risk regarding proper application of impact assessment and mitigation. This process is typically heavy in post-contract award oversight by CDOT environmental staff.

Construction Manager / General Contractor (CM/GC)

CM/GC is a project delivery method where a two-phase contract is awarded to a construction manager/general contractor for preconstruction services and construction services. The CM/GC contractor works in conjunction with the design engineer, who is selected using a qualifications-based procurement process. For the CM/GC method, CDOT may award the CM/GC contract based on competitive selection based on qualifications, experience, best value, or any other combination of factors. Under the preconstruction phase of the CM/GC contract, preliminary design may occur if the design does not limit the reasonable range of alternatives. The CM/GC construction services phase of the project may not be awarded until completion of the environmental review process. However, regulations allow the contracting agency to proceed with design activities at any level of detail for a project before completion of the NEPA review process at the expense of the contracting agency. CM/GC is generally the preferred method for environmental compliance since the construction contractor is finalizing the environmental requirements of the contract during final design BEFORE beginning construction. Therefore, not only is the environmental project certification able to be completed by the RPEM or their designee prior to construction, but the contractor is more familiar with what is expected of them regarding environmental issues and commitments.

Other types of project delivery methods that CDOT can use include Private Public Partnerships (PPP), and design, build, operate, maintain, and finance.

CDOT’s Design Bulletin 2011 Number 1 Permissible Activities During the NEPA Process provides additional guidance on innovative delivery methods and is available at:
3.7.4 Design-Build and CM/GC Contracting Restrictions During the NEPA Process

As described above, there are specific regulations and rules regarding the award of contracts to consulting and construction firms for project activities at various points in the NEPA process. These include conflict of interest and two stage contracting requirements. There are both federal and state requirements. The following should be reviewed when anticipating contracting using these methods:

- 23 USC sec 112. Letting of Contracts
- 23 CFR sec 636. Design-Build Contracting
- 2 CCR 601-15. Rules to Establish Requirements for Procurement by the Colorado Department of Transportation for Design-Build Contracts for Transportation Projects

3.7.5 Other Measures to Accelerate Project Delivery

MAP-21 has identified other permissible actions, such as advanced acquisition of real property interests and accelerated decision-making, to accelerate project delivery. An outline of MAP-21 is provided in Chapter 2, Section 2.6.
