Leaking Underground Storage Tanks

For some road construction projects, the Colorado Department of Transportation (CDOT) needs to acquire private property for use as highway right-of-way. The property may contain an underground storage tank for gasoline or other chemicals. If the tank has leaked, nearby soil or groundwater has been contaminated. These sites are tracked and monitored by the Colorado Department of Public Health and Environment.

For the protection of highway construction workers and the general public, complete cleanup including proper removal and disposal of all contaminated materials is required of the owner before such a site is acquired for CDOT right-of-way.
