

## Transportation Engineering Training Program (TETP)

# TETP News and Events Update

April 2017

## Upcoming Courses:

### April 4-6 - Writing for Engineering Professionals

Writing for Engineering Professionals is a Technical-writing classroom training program of three individual classes, customized for those in civil engineering, the environmental sciences, construction, and related fields. Writing is taught as a science, not an art. Metrics and strategies are provided as objective measures of writing's clarity and conciseness. Classes can be taken separately or in a series.

### April 18 - Managing Contract Time

The online section of this course familiarizes learners with important information found in existing CDOT materials relating to managing contract time and addressing delays. Project Managers and Project Engineers learn about how to identify types of delays, establish contract time and determine when to use different contract types and methods. Includes prerequisite online course "Managing Contract Time".

### April 20 - Design Work Hour Estimation

This course provides the fundamentals for developing work-hour estimates for both in-house and consultant staffed projects. Participants establish core knowledge on developing a detailed project scope of work using CDOT's Generic Scope of Work. Includes prerequisite online course "Scope of Work".

### Construction Project Financials

This newly developed online course identifies and explores the Project Financials Statement, more commonly known as Form 65, and how you can identify, interpret and understand the financial status of your project, focusing on Post Award.
