The I-70 Mountain Corridor CSS process provides guidance for future studies, designs, and construction projects to ensure that stakeholder values, such as preserving and maintaining scenic and environmental integrity, are incorporated into the project decision making process.

The CSS process is implemented for all Tier 2 projects along the corridor and is used through the entirety of a projects life. The CSS process involves several teams that collaborate through each life cycle phase. The teams and an overview of their roles are described on the right.

For more information about the I-70 Mountain Corridor CSS process visit: https://www.codot.gov/projects/contextsensitivesolutions
